Memcached Service Accessible Without Authentication port 11211 / tcp

PCI COMPLIANCE STATUS

Category:	General remote services
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2019-02-07 10:57:24.0

THREAT:

Memcached is a general-purpose distributed memory caching system. It is often used to speed up dynamic database-driven websites by caching data and objects in RAM to reduce the number of times an external data source must be read.

The target is running Memcached service with authentication disabled.

QID Detection Logic (Unauthenticated):
This QID sends a crafted TCP packet to the target memcached service to check it's accessible without any authentication.

IMPACT:

An unauthenticated, remote attacker could exploit this vulnerability to retrieve sensitive information.

SOLUTION:

Customers are advised to enable authentication for memcached service.

Memcached Insecure Configuration Vulnerability

PCI COMPLIANCE STATUS

PCI Severity Level: MED

FAIL

The vulnerability is not included in the NVD.

VULNERABILITY DETAILS

CVSS Base Score:	**5** AV:N/AC:L/Au:N/C:P/I:N/A:N
CVSS Temporal Score:	**4.1** E:POC/RL:W/RC:UR
Severity:	**3**

Category:	General remote services
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2019-05-17 06:30:27.0

THREAT:

Memcached is a high performance, distributed memory object caching system intended for use in speeding up dynamic Web applications by alleviating database load.

By default, it serves on TCP port 11211.

Memcached does not effectively ensure defensibility from random Internet connections. Insecure configuration might expose Memcached directly to the Internet, causing leakage of confidential information.

IMPACT:

By exploiting this vulnerability, an attacker can gain confidential information of the target.

SOLUTION:

Workaround:

1. In a local environment, an administrator can employ parameter "-l 127.0.0.1" to disallow connection from other hosts.
2. In a distributed network environment, a firewall must be configured to protect the Memcached listening port from untrusted connections.

For more information about secure configuration, please refer to Memcached Wiki.

Bugtraq ID:	-
Last Update:	2023-07-18 12:21:34.0

THREAT:

This host has a publicly-accessible PHP file that calls the phpinfo() function (or some other function similar to it).

If a user requests this file (such as via an Internet browser), the user may obtain a page containing sensitive information about the Web server host. The information displayed to the user could include the exact version numbers of various software products (Operating Systems, Web Servers, PHP, XML, MySQL), the values of some environment variables ($PATH, $SYSTEM_ROOT), paths to various programs (cmd.exe), and much more.

To get specific information about the type of data your host displayed, please refer to the "Result" field below.

IMPACT:

By exploiting this vulnerability, any user could obtain very sensitive information about the Web server host. This information may aid in attacks against the host.

SOLUTION:

You should immediately remove all such files from the public domain on your Web server.

VULNERABILITY DETAILS

CVSS Base Score:	**4.3** AV:N/AC:M/Au:N/C:N/I:P/A:N
CVSS Temporal Score:	**3.5** E:U/RL:U/RC:UR
Severity:	**2**
QID:	11827
Category:	CGI
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2025-01-02 19:23:28.0

THREAT:

This QID reports the absence of the following HTTP headers according to CWE-693: Protection Mechanism Failure:
X-Content-Type-Options: This HTTP header will prevent the browser from interpreting files as a different MIME type to what is specified in the Content-Type HTTP header.
Strict-Transport-Security: The HTTP Strict-Transport-Security response header (HSTS) allows web servers to declare that web browsers (or other complying user agents) should only interact with it using secure HTTPS connections, and never via the insecure HTTP protocol.

QID Detection Logic:
This unauthenticated QID will send a GET request sent to '/' (default) endpoint and looks for the presence of the following HTTP Headers in the received response:
The Valid directives are as belows: X-Content-Type-Options: nosniff

Strict-Transport-Security: max-age=< [;includeSubDomains]

IMPACT:

Depending on the vulnerability being exploited, an unauthenticated remote attacker could conduct cross-site scripting, clickjacking or MIME-type sniffing attacks.

SOLUTION:

Note: To better debug the results of this QID, it is requested that customers execute commands to simulate the following functionality: curl -lkL --verbose.

CWE-693: Protection Mechanism Failure mentions the following - The product does not use or incorrectly uses a protection mechanism that provides sufficient defense against directed attacks against the product. A "missing" protection mechanism occurs when the application does not define any mechanism against a certain class of attack. An "insufficient" protection mechanism might provide some defenses - for example, against the most common attacks - but it does not protect against everything that is intended. Finally, an "ignored" mechanism occurs when a mechanism is available and in active use within the product, but the developer has not applied it in some code path.

Customers are advised to set proper X-Content-Type-Options and Strict-Transport-Security HTTP response headers.

Depending on their server software, customers can set directives in their site configuration or Web.config files. Few examples are:

X-Content-Type-Options:
Apache: Header always set X-Content-Type-Options: nosniff

HTTP Strict-Transport-Security:
Apache: Header always set Strict-Transport-Security "max-age=31536000; includeSubDomains"
Nginx: add_header Strict-Transport-Security max-age=31536000;

Note: Network devices that include a HTTP/HTTPS console for administrative/management purposes often do not include all/some of the security headers. This is a known issue and it is recommend to contact the vendor for a solution.

RESULT:

X-Content-Type-Options HTTP Header missing on port 80.

TCP Sequence Number Approximation Based Denial of Service

PCI COMPLIANCE STATUS

PCI Severity Level: MED

PASS — The vulnerability is purely a denial-of-service (DoS) vulnerability.

VULNERABILITY DETAILS

CVSS Base Score:	**5.0** AV:N/AC:L/Au:N/C:N/I:N/A:P
CVSS Temporal Score:	**4.3** E:F/RL:T/RC:C
Severity:	**3**
QID:	82054
Category:	TCP/IP
CVE ID:	CVE-2004-0230
Vendor Reference:	-
Bugtraq ID:	10183
Last Update:	2024-02-29 00:00:01.0

THREAT:

TCP provides stateful communications between hosts on a network. TCP sessions are established by a three-way handshake and use random 32-bit sequence and acknowledgement numbers to ensure the validity of traffic. A vulnerability was reported that may permit TCP sequence numbers to be more easily approximated by remote attackers. This issue affects products released by multiple vendors.

The cause of the vulnerability is that affected implementations will accept TCP sequence numbers within a certain range, known as the acknowledgement range, of the expected sequence number for a packet in the session. This is determined by the TCP window size, which is negotiated during the three-way handshake for the session. Larger TCP window sizes may be set to allow for more throughput, but the larger the TCP window size, the more probable it is to guess a TCP sequence number that falls within an acceptable range. It was initially thought that guessing an acceptable sequence number was relatively difficult for most implementations given random distribution, making this type of attack impractical. However, some implementations may make it easier to successfully approximate an acceptable TCP sequence number, making these attacks possible with a number of protocols and implementations.

This is further compounded by the fact that some implementations may support the use of the TCP Window Scale Option, as described in RFC 1323, to extend the TCP window size to a maximum value of 1 billion.

This vulnerability will permit a remote attacker to inject a SYN or RST packet into the session, causing it to be reset and effectively allowing for denial of service attacks. An attacker would exploit this issue by sending a packet to a receiving implementation with an approximated sequence number and a forged source IP address and TCP port.

There are a few factors that may present viable target implementations, such as those which depend on long-lived TCP connections, those that have known or easily guessed IP address endpoints and those implementations with easily guessed TCP source ports. It has been noted that Border Gateway Protocol (BGP) is reported to be particularly vulnerable to this type of attack, due to the use of long-lived TCP sessions and the possibility that some implementations may use the TCP Window Scale Option. As a result, this issue is likely to affect a number of routing platforms.

Another factor to consider is the relative difficulty of injecting packets into TCP sessions, as a number of receiving implementations will reassemble packets in order, dropping any duplicates. This may make some implementations more resistant to attacks than others.

It should be noted that while a number of vendors have confirmed this issue in various products, investigations are ongoing and it is likely that many other vendors and products will turn out to be vulnerable as the issue is investigated further.

IMPACT:

Successful exploitation of this issue could lead to denial of service attacks on the TCP based services of target hosts.

SOLUTION:

Please first check the results section below for the port number on which this vulnerability was detected. If that port number is known to be used for port-forwarding, then it is the backend host that is really vulnerable.

Various implementations and products including Check Point, Cisco, Cray Inc, Hitachi, Internet Initiative Japan, Inc (IIJ), Juniper Networks, NEC and Yamaha are currently undergoing review. Contact the vendors to obtain more information about affected products and fixes. NISCC Advisory 236929 - Vulnerability Issues in TCP details the vendor patch status as of the time of the advisory, and identifies resolutions and workarounds.

Refer to US-CERT Vulnerability Note VU#415294 and OSVDB Article 4030 to obtain a list of vendors affected by this issue and a note on resolutions (if any) provided by the vendor.

For Microsoft: Refer to MS05-019 and MS06-064 for further details.

For SGI IRIX: Refer to SGI Security Advisory 20040905-01-P

For SCO UnixWare 7.1.3 and 7.1.1: Refer to SCO Security Advisory SCOSA-2005.14

For Solaris (Sun Microsystems): The vendor has acknowledged the vulnerability; however a patch is not available. Refer to Sun Microsystems, Inc. Information for VU#415294 to obtain additional details. Also, refer to TA04-111A for detailed mitigating strategies against these attacks.

For NetBSD: Refer to NetBSD-SA2004-006

For Cisco: Refer to cisco-sa-20040420-tcp-ios.shtml.

For IBM : Refer to IBM-tcp-sequence-number-cve-2004-0230.

For Red Hat Linux: There is no fix available : Refer to .

Workaround:
The following BGP-specific workaround information has been provided.

For BGP implementations that support it, the TCP MD5 Signature Option should be enabled. Passwords that the MD5 checksum is applied to should be set to strong values and changed on a regular basis.

Secure BGP configuration instructions have been provided for Cisco and Juniper at these locations:
Secure Cisco IOS BGP Template
JUNOS Secure BGP Template

RESULT:
Tested on port 80 with an injected SYN/RST offset by 16 bytes.

CVSS Temporal Score:	**2.0** E:U/RL:W/RC:UR
Severity:	**1**
QID:	150222
Category:	Web Application
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2024-08-03 05:00:01.0

THREAT:
Reverse Tabnabbing is an attack where the target page is replaced by phishing site. This is possible when target="_blank" is in use with rel="noopener" or rel="noreferrer", attacker can use JavaScript window.opener and inject malicious domain in it. When user clicks on html link, they will get redirected to phishing or unintentional website.
WAS detects this vulnerability during crawling and evaluates HTML links embedded in anchor tags.

IMPACT:
The user may be redirected to an untrusted page that contains undesired content or malicious script code.

SOLUTION:
Use either of these attributes rel="noreferrer" or rel="noopener".
Implement Cross Origin Opener Policy header.

Vendor Reference:	Apache_http_server
Bugtraq ID:	-
Last Update:	2024-08-20 12:27:20.0

THREAT:
Apache HTTP Server is an HTTP web server application.

CVE-2022-28330: Apache HTTP Server 2.4.53 and earlier on Windows may read beyond bounds when configured to process requests with the mod_isapi module.
CVE-2022-28614: The ap_rwrite() function in Apache HTTP Server 2.4.53 and earlier may read unintended memory if an attacker can cause the server to reflect very large input using ap_rwrite() or ap_rputs(), such as with mod_luas r:puts() function.
CVE-2022-28615: Apache HTTP Server 2.4.53 and earlier may crash or disclose information due to a read beyond bounds in ap_strcmp_match() when provided with an extremely large input buffer.
CVE-2022-29404: In Apache HTTP Server 2.4.53 and earlier, a malicious request to a lua script that calls r:parsebody(0) may cause a denial of service due to no default limit on possible input size.
CVE-2022-30556: Apache HTTP Server 2.4.53 and earlier may return lengths to applications calling r:wsread() that point past the end of the storage allocated for the buffer.

Affected Versions:
Apache HTTP Server versions 2.4.53 and earlier

QID Detection Logic:(Unauthenticated)
This QID checks for server banners to detect if the target is running the vulnerable version of apache httpd.

IMPACT:
Successful exploitation of this vulnerability may compromise Confidentiality, Integrity, and Availability of the Data.

SOLUTION:
Customers are advised to update latest Apache httpd
For more information, visit here.

CVE ID:	CVE-2023-28531
Vendor Reference:	OpenSSH Advisory
Bugtraq ID:	-
Last Update:	2024-12-11 13:21:59.0

THREAT:
OpenSSH (OpenBSD Secure Shell) is a set of computer programs providing encrypted communication sessions over a computer network using the SSH protocol.

Affected Versions:
OpenSSH version 8.9 and above prior to 9.3

QID Detection Logic:
This unauthenticated detection works by reviewing the version of the OpenSSH service.

IMPACT:
Successfully exploitation of this vulnerability could lead to disclosure of sensitive information, addition or modification of data, or Denial of Service (DoS).

SOLUTION:
Customers are advised to upgrade to OpenSSH 9.3 or later to remediate these vulnerabilities.

CVE ID:	CVE-2024-40898
Vendor Reference:	Apache HTTP Server
Bugtraq ID:	-
Last Update:	2024-11-13 18:02:42.0

THREAT:
Apache HTTP Server, colloquially called Apache, is a free and open-source cross-platform web server software.

Multiple versions of Apache HTTP Server on Windows are affected by a Server-Side Request Forgery (SSRF) Vulnerability with mod_rewrite in server/vhost context.

Affected Versions:
Apache HTTP Server versions from 2.4.0 prior to 2.4.62

QID Detection Logic (Unauthenticated):
This QID sends an HTTP GET request and checks the HTTP response headers to confirm if the host is running vulnerable version of Apache HTTP Server.

IMPACT:
Successful exploitation of this vulnerability could potentially leak NTML hashes to a malicious server via SSRF and malicious requests.

SOLUTION:
Customers are advised to upgrade to Apache HTTP Server 2.4.62 or later version to remediate this vulnerability. For more information related to this vulnerability please refer to Apache HTTP Server Security.

Vendor Reference:	Apache_http_server
Bugtraq ID:	-
Last Update:	2024-08-20 12:27:20.0

THREAT:
Apache HTTP Server is an HTTP web server application.

CVE-2006-20001: A carefully crafted If: request header can cause a memory read, or write of a single zero byte, in a pool (heap) memory location beyond the header value sent. This could cause the process to crash.
CVE-2022-37436: A malicious backend can cause the response headers to be truncated early, resulting in some headers being incorporated into the response body. If the later headers have any security purpose, they will not be interpreted by the client.

Affected Versions:
Apache HTTP Server versions prior to 2.4.55

QID Detection Logic:(Unauthenticated)
This QID checks for server banner to detect if the target is running vulnerable version of apache httpd.

IMPACT:
Successful exploitation of this vulnerability may result in the breach of Confidentiality, Integrity, and Availability of data.

SOLUTION:
Customers are advised to update the latest Apache HTTP Server versions 2.4.55 or later.

Last Update:	2024-12-13 12:00:01.0

THREAT:
The Apache HTTP Server, colloquially called Apache, is a free and open-source cross-platform web server software.

Affected versions of Apache HTTP Server has multiple vulnerabilities:

DoS by Null pointer in websocket over HTTP/2 (CVE-2024-36387): Serving WebSocket protocol upgrades over a HTTP/2 connection could result in a Null Pointer dereference, leading to a crash of the server process, degrading performance.

Windows UNC SSRF (CVE-2024-38472): SSRF in Apache HTTP Server on Windows allows to potentially leak NTML hashes to a malicious server via SSRF and malicious requests or content.
Note: Existing configurations that access UNC paths will have to configure new directive "UNCList" to allow access during request processing.

Proxy encoding problem (CVE-2024-38473): Encoding problem in mod_proxy allows request URLs with incorrect encoding to be sent to backend services, potentially bypassing authentication via crafted requests.

Weakness with encoded question marks in backreferences (CVE-2024-38474): Substitution encoding issue in mod_rewrite. Allows attacker to execute scripts in directories permitted by the configuration but not directly reachable by any URL or source disclosure of scripts meant to only to be executed as CGI.

Weakness in mod_rewrite when first segment of substitution matches filesystem path. (CVE-2024-38475): Improper escaping of output in mod_rewrite. Allows an attacker to map URLs to filesystem locations that are permitted to be served by the server but are not intentionally/directly reachable by any URL, resulting in code execution or source code disclosure.

Crash resulting in Denial of Service in mod_proxy via a malicious request (CVE-2024-38477): null pointer dereference in mod_proxy. Allows an attacker to crash the server via a malicious request.

mod_rewrite proxy handler substitution (CVE-2024-39573): Potential SSRF in mod_rewrite. Allows an attacker to cause unsafe RewriteRules to unexpectedly setup URLs to be handled by mod_proxy.

Affected Versions:

Vendor Reference:	OpenSSH 9.6
Bugtraq ID:	-
Last Update:	2024-12-11 13:21:59.0

THREAT:
OpenSSH is a set of computer programs providing encrypted communication sessions over a computer network using the SSH protocol.

In OpenSSH, when common types of DRAM are used, might allow row hammer attacks (for authentication bypass) because the integer value of authenticated in mm_answer_authpassword does not resist flips of a single bit.

Affected Versions:
OpenSSH up to version 9.6

QID Detection Logic:
This unauthenticated detection works by reviewing the version of the OpenSSH service.
IMPACT:
Successful exploitation allows OS command injection and row hammer attacks for authentication bypass.
SOLUTION:
There are no vendor supplied patches available at this time.

Bugtraq ID:	-
Last Update:	2024-12-30 13:21:09.0

THREAT:
Apache HTTP Server is a free and open-source cross-platform web server software, released under the terms of Apache License 2.0.

CVE-2022-22719 - A carefully crafted request body can cause a read to a random memory area which could cause the process to crash.
CVE-2022-22720 - Apache HTTP Server 2.4.52 and earlier fails to close inbound connection when errors are encountered discarding the request body, exposing the server to HTTP Request Smuggling
CVE-2022-22721 - If LimitXMLRequestBody is set to allow request bodies larger than 350MB (defaults to 1M) on 32 bit systems an integer overflow happens which later causes out of bounds writes.
CVE-2022-23943 - Out-of-bounds Write vulnerability in mod_sed of Apache HTTP Server allows an attacker to overwrite heap memory with possibly attacker provided data.

Affected Versions:
Apache HTTP Server 2.4 - 2.4.52

IMPACT:
Successful exploitation of the vulnerability may allow an attacker to redirect victim to a malicious server.

SOLUTION:
Customers are advised to update to Apache HTTP Server 2.4.53 or later. For more information, check Apache Security Advisory

THREAT:
Some mod_proxy configurations on Apache HTTP Server versions 2.4.0 through 2.4.55 allow a HTTP Request Smuggling attack.

Configurations are affected when mod_proxy is enabled along with some form of RewriteRule or ProxyPassMatch in which a non-specific pattern matches some portion of the user-supplied request-target (URL) data and is then re-inserted into the proxied request-target using variable substitution.

Affected Versions:
Apache HTTP Server Versions 2.4.0 through 2.4.55 (including)

QID Detection Logic(Unauthenticated):
This QID checks for vulnerable version of Apache HTTP Server by sending a GET request to a target and extracting the version from the response header.

IMPACT:
Request splitting/smuggling could result in bypass of access controls in the proxy server, proxying unintended URLs to existing origin servers, and cache poisoning.
SOLUTION:
Customers are advised to upgrade to Apache HTTP Server version 2.4.56 or later. For more information please refer to Apache HTTP Server Security Advisory

THREAT:
Apache HTTP Server is an HTTP web server application.

CVE-2022-26377: Inconsistent Interpretation of HTTP Requests ('HTTP Request Smuggling') vulnerability in mod_proxy_ajp of Apache HTTP Server allows an attacker to smuggle requests to the AJP server it forwards requests to.

Affected Versions:
Apache HTTP Server versions 2.4 to 2.4.53

QID Detection Logic:(Unauthenticated)
This QID checks for server banners to detect if the target is running vulnerable version of apache httpd.
IMPACT:
Successful exploitation of this vulnerability may allows an attacker to smuggle requests to the AJP server it forwards requests to.

Vendor Reference:	Apache Security Advisory
Bugtraq ID:	-
Last Update:	2024-12-30 13:21:09.0

THREAT:
Apache HTTP Server is a free and open-source cross-platform web server software, released under the terms of Apache License 2.0.

CVE-2022-22719 - A carefully crafted request body can cause a read to a random memory area which could cause the process to crash.
CVE-2022-22720 - Apache HTTP Server 2.4.52 and earlier fails to close inbound connection when errors are encountered discarding the request body, exposing the server to HTTP Request Smuggling
CVE-2022-22721 - If LimitXMLRequestBody is set to allow request bodies larger than 350MB (defaults to 1M) on 32 bit systems an integer overflow happens which later

causes out of bounds writes.
CVE-2022-23943 - Out-of-bounds Write vulnerability in mod_sed of Apache HTTP Server allows an attacker to overwrite heap memory with possibly attacker provided data.

Affected Versions:
Apache HTTP Server 2.4 - 2.4.52
IMPACT:
Successful exploitation of the vulnerability may allow an attacker to redirect victim to a malicious server.
SOLUTION:
Customers are advised to update to Apache HTTP Server 2.4.53 or later. For more information, check Apache Security Advisory

THREAT:
Apache HTTP Server is an HTTP web server application.

CVE-2006-20001: A carefully crafted If: request header can cause a memory read, or write of a single zero byte, in a pool (heap) memory location beyond the header value sent. This could cause the process to crash.
CVE-2022-37436: A malicious backend can cause the response headers to be truncated early, resulting in some headers being incorporated into the response body. If the later headers have any security purpose, they will not be interpreted by the client.

Affected Versions:
Apache HTTP Server versions prior to 2.4.55

QID Detection Logic:(Unauthenticated)
This QID checks for server banner to detect if the target is running vulnerable version of apache httpd.
IMPACT:
Successful exploitation of this vulnerability may result in the breach of Confidentiality, Integrity, and Availability of data.

THREAT:
The Apache HTTP Server, colloquially called Apache, is a free and open-source cross-platform web server software.

Affected versions of Apache HTTP Server has multiple vulnerabilities:

HTTP response splitting (CVE-2023-38709): Faulty input validation in the core of Apache allows malicious or exploitable backend/content generators to split HTTP responses.

HTTP Response Splitting in multiple modules (CVE-2024-24795): HTTP Response splitting in multiple modules in Apache HTTP Server allows an attacker that can inject malicious response headers into backend applications to cause an HTTP desynchronization attack.

Affected Versions:
Apache HTTP Server version from 2.4.0 to 2.4.58

QID Detection Logic (Unauthenticated):
This QID sends a HTTP GET request and checks the response headers to confirm if the host is running vulnerable version of Apache HTTP Server.

IMPACT:
Successful exploitation of this vulnerability could allow attackers to split HTTP responses, which can lead to injecting harmful content or causing server issues.

Vendor Reference:	Apache_http_server
Bugtraq ID:	-
Last Update:	2024-08-20 12:27:20.0

THREAT:
Apache HTTP Server is an HTTP web server application.

CVE-2023-31122: Out-of-bounds Read vulnerability in mod_macro of Apache HTTP Server.This issue affects Apache HTTP Server
CVE-2023-45802: A client could send new requests and resets, keeping the connection busy and open and causing the memory footprint to keep on growing. On connection close, all resources were reclaimed, but the process might run out of memory before that.

Affected Versions:
Apache HTTP Server versions prior to 2.4.58

QID Detection Logic:(Unauthenticated)
This QID checks for server banner to detect if the target is running vulnerable version of apache httpd.
IMPACT:
Successful exploitation of this vulnerability may result in the breach of Confidentiality, Integrity, and Availability of data.
SOLUTION:
Customers are advised to update the latest Apache HTTP Server versions 2.4.58 or later.
For further information, please refer to Apache HTTP Server Security Advisory.

Vendor Reference:	Apache HTTP Server 2.4 vulnerabilities
Bugtraq ID:	-
Last Update:	2024-06-02 12:01:45.0

THREAT:
The Apache HTTP Server, colloquially called Apache, is a free and open-source cross-platform web server software.

Affected versions of Apache HTTP Server has multiple vulnerabilities:
CVE-2023-31122 : Out-of-bounds Read vulnerability in mod_macro of Apache HTTP Server
CVE-2023-43622 : DoS in HTTP/2 with initial windows size 0
CVE-2023-45802 : When a HTTP/2 stream was reset (RST frame) by a client, there was a time window were the requests memory resources were not reclaimed immediately. Instead, de-allocation was deferred to connection close. A client could send new requests and resets, keeping the connection busy and open and causing the memory footprint to keep on growing. On connection close, all resources were reclaimed, but the process might run out of memory before that.

Affected Versions:
Apache HTTP Server version from 2.4.0 to 2.4.57

QID Detection Logic (Unauthenticated):
This QID sends a HTTP GET request and checks the response headers to confirm if the host is running vulnerable version of Apache HTTP Server.
IMPACT:
Exploitation of the vulnerability could lead to uncontrolled resource consumption or buffer over-read.
SOLUTION:
Customers are advised to upgrade to the latest version of Apache HTTP Server to remediate this vulnerability. For more information related to this vulnerability please refer to Apache's Security advisory

Remote Access or Management Service Detected

PCI COMPLIANCE STATUS

PASS

VULNERABILITY DETAILS

Severity: **3**
QID: 42017

Category:	General remote services
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2024-05-20 12:30:20.0

THREAT:
A remote access or remote management service was detected. If such a service is accessible to malicious users it can be used to carry different type of attacks. Malicious users could try to brute force credentials or collect additional information on the service which could enable them in crafting further attacks.

The Results section includes information on the remote access service that was found on the target.

Services like Telnet, Rlogin, SSH, windows remote desktop, pcAnywhere, Citrix Management Console, Remote Admin (RAdmin), VNC, OPENVPN and ISAKMP are checked.

IMPACT:
Consequences vary by the type of attack.

SOLUTION:
Expose the remote access or remote management services only to the system administrators or intended users of the system.

RESULT:
Service name: SSH on TCP port 22.

Host Uptime Based on TCP TimeStamp Option

PCI COMPLIANCE STATUS

PASS

VULNERABILITY DETAILS

Severity:	**2**
QID:	82063
Category:	TCP/IP
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2007-05-29 18:56:36.0

THREAT:

The TCP/IP stack on the host supports the TCP TimeStamp (kind 8) option. Typically the timestamp used is the host's uptime (since last reboot) in various units (e.g., one hundredth of second, one tenth of a second, etc.). Based on this, we can obtain the host's uptime. The result is given in the Result section below.

Some operating systems (e.g., MacOS, OpenBSD) use a non-zero, probably random, initial value for the timestamp. For these operating systems, the uptime obtained does not reflect the actual uptime of the host; the former is always larger than the latter.

IMPACT:

N/A

SOLUTION:

N/A

RESULT:

Based on TCP timestamps obtained via port 22, the host's uptime is 21 days, 8 hours, and 58 minutes.
The TCP timestamps from the host are in units of 1 milliseconds.

Connection Error Occurred During Application Scan — port 4000 / tcp

PCI COMPLIANCE STATUS

PASS

VULNERABILITY DETAILS

Severity:	**2**
QID:	150018
Category:	Web Application
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2025-02-08 02:07:37.0

THREAT:
The following are some of the possible reasons for the timeouts or connection errors:

1. A disturbance in network connectivity between the scanner and the application occurred.
2. The web server or application server hosting the application was taken down in the midst of a scan.
3. The web application experienced an overload, possibly due to load generated by the scan.
4. An error occurred in the SSL/TLS handshake (applies to HTTPS web applications only).
5. A security device, such as an IDS/IPS or web application firewall (WAF), began to drop or reject the HTTP connections from the scanner.
6. Very large files like PDFs, videos, etc. are present on the site and caused timeouts when accessed by the scanner.

IMPACT:
Some of the resources were not accessible. Results may be incomplete or incorrect.

SOLUTION:

First, confirm that the server was not taken down in the midst of the scan. After that, investigate the root cause by reviewing the listed links and examining web server logs, application server logs, or IDS/IPS/WAF logs. If the errors are caused due to load generated by the scanner then try reducing the scan intensity (this could increase the scan duration). If the errors are due to specific URLs being tested by the scanner or due to specific form data sent by the scanner, then configure exclude lists in the scan configuration as needed to avoid such requests. If timeouts or connection errors are a persistent issue but you want the scan to run to completion, change the Behavior Settings in the option profile to increase the error thresholds or disable the error checks entirely.

RESULT:

Total number of unique links that encountered connection errors: 92

QID:	45017
Category:	Information gathering
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2025-02-11 13:32:02.0

THREAT:
Several different techniques can be used to identify the operating system (OS) running on a host. A short description of these techniques is provided below. The specific technique used to identify the OS on this host is included in the RESULTS section of your report.

1) **TCP/IP Fingerprint**: The operating system of a host can be identified from a remote system using TCP/IP fingerprinting. All underlying operating system TCP/IP stacks have subtle differences that can be seen in their responses to specially-crafted TCP packets. According to the results of this "fingerprinting" technique, the OS version is among those listed below.

Note that if one or more of these subtle differences are modified by a firewall or a packet filtering device between the scanner and the host, the fingerprinting technique may fail. Consequently, the version of the OS may not be detected correctly. If the host is behind a proxy-type firewall, the version of the operating system detected may be that of the firewall instead of the host being scanned.

2) **NetBIOS**: Short for Network Basic Input Output System, an application programming interface (API) that augments the DOS BIOS by adding special functions for local-area networks (LANs). Almost all LANs for PCs are based on the NetBIOS. Some LAN manufacturers have even extended it, adding additional network capabilities. NetBIOS relies on a message format called Server Message Block (SMB).

3) **PHP Info**: PHP is a hypertext pre-processor, an open-source, server-side, HTML-embedded scripting language used to create dynamic Web pages. Under some configurations it is possible to call PHP functions like phpinfo() and obtain operating system information.

4) **SNMP**: The Simple Network Monitoring Protocol is used to monitor hosts, routers, and the networks to which they attach. The SNMP service maintains Management Information Base (MIB), a set of variables (database) that can be fetched by Managers. These include "MIB_II.system.sysDescr" for the operating system.

Links Rejected By Crawl Scope or Exclusion List — port 80 / tcp

PCI COMPLIANCE STATUS

PASS

VULNERABILITY DETAILS

Severity:	**1**
QID:	150020
Category:	Web Application
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2022-02-07 16:48:28.0

THREAT:
One or more links were not crawled because of an explicit rule to exclude them. This also occurs if a link is malformed.

Exclude list and Include list entries can cause links to be rejected. If a scan is limited to a specific starting directory, then links outside that directory will neither be crawled or tested.

Links that contain a host name or IP address different from the target application are considered external links and not crawled by default; those types of links are not listed here. This often happens when the scope of a scan is limited to the directory of the starting URL. The scope can be changed in the Web Application Record.

During the test phase, some path-based tests may be rejected if the scan is limited to the directory of the starting URL and the test would fall outside that directory. In these cases, the number of rejected links may be too high to list in the Results section.

IMPACT:
Links listed here were neither crawled or tested by the Web application scanning engine.

SOLUTION:
A link might have been intentionally matched by a exclude or include list entry. Verify that no links in this list were unintentionally rejected.

RESULT:
Links not permitted:

Category:	TCP/IP
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2004-11-19 21:53:59.0

THREAT:
TCP Initial Sequence Numbers (ISNs) obtained in the SYNACK replies from the host are analyzed to determine how random they are. The average change between subsequent ISNs and the standard deviation from the average are displayed in the RESULT section. Also included is the degree of difficulty for exploitation of the TCP ISN generation scheme used by the host.

IMPACT:
N/A

SOLUTION:
N/A

RESULT:
Average change between subsequent TCP initial sequence numbers is 1014134194 with a standard deviation of 632419626. These TCP initial sequence numbers were triggered by TCP SYN probes sent to the host at an average rate of 1/(5138 microseconds). The degree of difficulty to exploit the TCP initial sequence number generation scheme is: hard.

Referrer-Policy HTTP Security Header Not Detected — port 4001 / tcp

PCI COMPLIANCE STATUS

VULNERABILITY DETAILS

Severity:	1
QID:	48131
Category:	Information gathering
CVE ID:	-
Vendor Reference:	Referrer-Policy
Bugtraq ID:	-
Last Update:	2023-01-18 13:30:16.0

THREAT:
No Referrer Policy is specified for the link. It checks for one of the following Referrer Policy in the response headers:

1) no-referrer
2) no-referrer-when-downgrade
3) same-origin
4) origin
5) origin-when-cross-origin
6) strict-origin
7) strict-origin-when-cross-origin

QID Detection Logic(Unauthenticated):
If the Referrer Policy header is not found , checks in response body for meta tag containing tag name as "referrer" and one of the above Referrer Policy.

IMPACT:
The Referrer-Policy header controls how much referrer information is sent to a site when navigating to it. Absence of Referrer-Policy header can lead to leakage of sensitive information via the referrer header.

SOLUTION:
Referrer Policy header improves security by ensuring websites don't leak sensitive information via the referrer header. It's recommended to add secure Referrer Policies as a part of a defense-in-depth approach.

Bugtraq ID:	-
Last Update:	2022-09-15 18:02:52.0

THREAT:
The Host Scan Time is the period of time it takes the scanning engine to perform the vulnerability assessment of a single target host. The Host Scan Time for this host is reported in the Result section below.

The Host Scan Time does not have a direct correlation to the Duration time as displayed in the Report Summary section of a scan results report. The Duration is the period of time it takes the service to perform a scan task. The Duration includes the time it takes the service to scan all hosts, which may involve parallel scanning. It also includes the time it takes for a scanner appliance to pick up the scan task and transfer the results back to the service's Secure Operating Center. Further, when a scan task is distributed across multiple scanners, the Duration includes the time it takes to perform parallel host scanning on all scanners.

IMPACT:

Links Rejected By Crawl Scope or Exclusion List — port 4000 / tcp

PCI COMPLIANCE STATUS

PASS

VULNERABILITY DETAILS

Severity:	1
QID:	150020
Category:	Web Application
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2022-02-07 16:48:28.0

THREAT:
One or more links were not crawled because of an explicit rule to exclude them. This also occurs if a link is malformed.

Exclude list and Include list entries can cause links to be rejected. If a scan is limited to a specific starting directory, then links outside that directory will neither be crawled or tested.

Links that contain a host name or IP address different from the target application are considered external links and not crawled by default; those types of links are not listed here. This often happens when the scope of a scan is limited to the directory of the starting URL. The scope can be changed in the Web Application Record.

During the test phase, some path-based tests may be rejected if the scan is limited to the directory of the starting URL and the test would fall outside that directory. In these cases, the number of rejected links may be too high to list in the Results section.

IMPACT:
Links listed here were neither crawled or tested by the Web application scanning engine.

SOLUTION:
A link might have been intentionally matched by a exclude or include list entry. Verify that no links in this list were unintentionally rejected.

RESULT:
Links not permitted:
(This list includes links from QIDs: 150010,150041,150143,150170)

Category:	Web Application
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2009-01-16 18:02:19.0

THREAT:
This check provides various details of the scan's performance and behavior. In some cases, this check can be used to identify problems that the scanner encountered when crawling the target Web application.

IMPACT:
The scan diagnostics data provides technical details about the crawler's performance and behavior. This information does not necessarily imply problems with the Web application.

SOLUTION:
No action is required.

RESULT:

VULNERABILITY DETAILS

Severity:	1
QID:	150845
Category:	Web Application
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2024-10-21 20:23:02.0

THREAT:
External domains detected in the application. Using external domains in an application introduces risk by potentially exposing the application to external threats and dependencies, which can be exploited for malicious purposes such as data exfiltration, phishing, or compromise of application integrity. These vulnerabilities arise from inadequate validation, reliance on unsecured external services, and the application's failure to enforce strict security controls over external interactions.

IMPACT:
N/A

SOLUTION:
Audit external domains accessed by your application. If possible launch scans against those.

RESULT:
External domains could be involved in potential business logic abuse.

Web Server Supports HTTP Request Pipelining — port 80 / tcp

PCI COMPLIANCE STATUS

PASS

VULNERABILITY DETAILS

Severity:	1
QID:	86565
Category:	Web server
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2005-02-23 00:25:38.0

THREAT:
Version 1.1 of the HTTP protocol supports URL-Request Pipelining. This means that instead of using the "Keep-Alive" method to keep the TCP connection alive over multiple requests, the protocol allows multiple HTTP URL requests to be made in the same TCP packet. Any Web server which is HTTP 1.1 compliant should then process all the URLs requested in the single TCP packet and respond as usual.

The target Web server was found to support this functionality of the HTTP 1.1 protocol.

IMPACT:
Support for URL-Request Pipelining has interesting consequences. For example, as explained in this paper by Daniel Roelker, it can be used for evading detection by Intrusion Detection Systems. Also, it can be used in HTTP Response-Spliting style attacks.

VULNERABILITY DETAILS

Severity:	**1**
QID:	45391
Category:	Information gathering
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-

Last Update: 2024-12-11 13:21:59.0

THREAT:

The Apache HTTP Server Project is an effort to develop and maintain an open-source HTTP server for modern operating systems including UNIX and Windows. The goal of this project is to provide a secure, efficient and extensible server that provides HTTP services in sync with the current HTTP standards.

Apache HTTP Server was detected on the target.

QID Detection Logic (Authenticated):
Operating System: Linux
The detection looks for Apache HTTP Server installation path using ps command. The version is extracted from the Apache HTTP Server's binary.
Operating System: Windows
This QID checks Windows registry to see if Apache HTTP Server is installed. If found, it displays the installed version.

THREAT:
ICMP (Internet Control and Error Message Protocol) is a protocol encapsulated in IP packets. ICMP's principal purpose is to provide a protocol layer that informs gateways of the inter-connectivity and accessibility of other gateways or hosts.

We have sent the following types of packets to trigger the host to send us ICMP replies:

Echo Request (to trigger Echo Reply)
Timestamp Request (to trigger Timestamp Reply)
Address Mask Request (to trigger Address Mask Reply)
UDP Packet (to trigger Port Unreachable Reply)
IP Packet with Protocol >= 250 (to trigger Protocol Unreachable Reply)

Listed in the "Result" section are the ICMP replies that we have received.

Web Server Supports HTTP Request Pipelining — port 443 / tcp

PCI COMPLIANCE STATUS

PASS

VULNERABILITY DETAILS

Severity:	1
QID:	86565
Category:	Web server
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2005-02-23 00:25:38.0

THREAT:
Version 1.1 of the HTTP protocol supports URL-Request Pipelining. This means that instead of using the "Keep-Alive" method to keep the TCP connection alive over multiple requests, the protocol allows multiple HTTP URL requests to be made in the same TCP packet. Any Web server which is HTTP 1.1 compliant should then process all the URLs requested in the single TCP packet and respond as usual.

The target Web server was found to support this functionality of the HTTP 1.1 protocol.

IMPACT:
Support for URL-Request Pipelining has interesting consequences. For example, as explained in this paper by Daniel Roelker, it can be used for evading detection by Intrusion Detection Systems. Also, it can be used in HTTP Response-Spliting style attacks.

Category:	Web Application
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2024-10-15 22:36:08.0

THREAT:
Using resources from external locations is a security concern, including third-party stylesheet. Also detection of all external resources would be a requirement for certifications and audits.

IMPACT:
Using css from untrusted sources can result in external CSS injection and allow attacker to gain sensitive information.

SOLUTION:
Verify all the external CSS loaded on application are valid and from known sources.

RESULT:
External CSS link found: <link rel="stylesheet" href="https://d7jummq9jo4cp.cloudfront.net/support/styles.128367470b8ed0ccca00.css" media="print" onload="this.media='all'">

Business logic abuse potential due to presence of external domains detected — port 4001 / tcp

PCI COMPLIANCE STATUS

QID:	150845
Category:	Web Application
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2024-10-21 20:23:02.0

THREAT:
External domains detected in the application. Using external domains in an application introduces risk by potentially exposing the application to external threats and dependencies, which can be exploited for malicious purposes such as data exfiltration, phishing, or compromise of application integrity. These vulnerabilities arise from inadequate validation, reliance on unsecured external services, and the application's failure to enforce strict security controls over external interactions.

IMPACT:
N/A

SOLUTION:
Audit external domains accessed by your application. If possible launch scans against those.

RESULT:
External domains could be involved in potential business logic abuse.

Category:	Web server
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2006-07-11 16:04:25.0

THREAT:

Apache installs foreign language files along with index.html. The files are as follows:

index.html.ca
index.html.de
index.html.dk
index.html.ee

An attacker can get additional information about the Web server from these files.

IMPACT:

Sensitive system information may be disclosed, which can be utilized by an attacker to aid further attacks.

SOLUTION:

Apache recommends to remove these files from the Web server.

RESULT:

GET /index.html.ru.iso-ru HTTP/1.1

Referrer-Policy HTTP Security Header Not Detected — port 4000 / tcp

PCI COMPLIANCE STATUS

PASS

VULNERABILITY DETAILS

Severity:	1
QID:	48131
Category:	Information gathering
CVE ID:	-
Vendor Reference:	Referrer-Policy
Bugtraq ID:	-
Last Update:	2023-01-18 13:30:16.0

THREAT:
No Referrer Policy is specified for the link. It checks for one of the following Referrer Policy in the response headers:

1) no-referrer
2) no-referrer-when-downgrade
3) same-origin
4) origin
5) origin-when-cross-origin
6) strict-origin
7) strict-origin-when-cross-origin

QID Detection Logic(Unauthenticated):
If the Referrer Policy header is not found , checks in response body for meta tag containing tag name as "referrer" and one of the above Referrer Policy.

IMPACT:
The Referrer-Policy header controls how much referrer information is sent to a site when navigating to it. Absence of Referrer-Policy header can lead to leakage of sensitive information via the referrer header.

SOLUTION:
Referrer Policy header improves security by ensuring websites don't leak sensitive information via the referrer header. It's recommended to add secure Referrer Policies as a part of a defense-in-depth approach.

References:

VULNERABILITY DETAILS

Severity:	1
QID:	150021
Category:	Web Application
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2009-01-16 18:02:19.0

THREAT:
This check provides various details of the scan's performance and behavior. In some cases, this check can be used to identify problems that the scanner encountered when crawling the target Web application.

IMPACT:
The scan diagnostics data provides technical details about the crawler's performance and behavior. This information does not necessarily imply problems with the Web application.

SOLUTION:
No action is required.

RESULT:
Target web application page http://38.91.100.5/ fetched. Status code:200, Content-Type:text/html, load time:110 milliseconds.

Links Rejected By Crawl Scope or Exclusion List — port 443 / tcp

PCI COMPLIANCE STATUS

PASS

VULNERABILITY DETAILS

Severity:	1
QID:	150020
Category:	Web Application
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2022-02-07 16:48:28.0

THREAT:

One or more links were not crawled because of an explicit rule to exclude them. This also occurs if a link is malformed.

Exclude list and Include list entries can cause links to be rejected. If a scan is limited to a specific starting directory, then links outside that directory will neither be crawled or tested.

Links that contain a host name or IP address different from the target application are considered external links and not crawled by default; those types of links are not listed here. This often happens when the scope of a scan is limited to the directory of the starting URL. The scope can be changed in the Web Application Record.

During the test phase, some path-based tests may be rejected if the scan is limited to the directory of the starting URL and the test would fall outside that directory. In these cases, the number of rejected links may be too high to list in the Results section.

IMPACT:

Links listed here were neither crawled or tested by the Web application scanning engine.

SOLUTION:

A link might have been intentionally matched by a exclude or include list entry. Verify that no links in this list were unintentionally rejected.

RESULT:

Links not permitted:
(This list includes links from QIDs: 150010,150041,150143,150170)

CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2009-01-16 18:02:19.0

THREAT:

This check provides various details of the scan's performance and behavior. In some cases, this check can be used to identify problems that the scanner encountered when crawling the target Web application.

IMPACT:

The scan diagnostics data provides technical details about the crawler's performance and behavior. This information does not necessarily imply problems with the Web application.

SOLUTION:

No action is required.

Category:	Information gathering
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2013-08-15 21:12:37.0

THREAT:
The information shown in the Result section was returned by the network infrastructure responsible for routing traffic from our cloud platform to the target network (where the scanner appliance is located).

This information was returned from: 1) the WHOIS service, or 2) the infrastructure provided by the closest gateway server to our cloud platform. If your ISP is routing traffic, your ISP's gateway server returned this information.

IMPACT:
This information can be used by malicious users to gather more information about the network infrastructure that may help in launching attacks against it.

SOLUTION:
N/A

RESULT:
The network handle is: COGENT-A

Category:	General remote services
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2024-09-20 19:30:41.0

THREAT:
SSH is a secure protocol, provided it is fully patched, properly configured, and uses FIPS approved algorithms.

Supported ciphers suites reported in this qid are in server-preferred order.

```
For Red Hat ES 4:-
SSH1 supported                                  yes
Supported authentification methods for SSH1     RSA,password
Supported ciphers for SSH1                      3des,blowfish
SSH2 supported                                  yes
Supported keys exchange algorithm for SSH2      diffie-hellman-group-exchange-sha1,diffie-hellman-group14-sha1,diffie-hellman-
Supported decryption ciphers for SSH2           aes128-cbc,3des-cbc,blowfish-cbc,cast128-cbc,arcfour,aes192-cbc,aes256-cbc,rij
Supported encryption ciphers for SSH2           aes128-cbc,3des-cbc,blowfish-cbc,cast128-cbc,arcfour,aes192-cbc,aes256-cbc,rij
Supported decryption mac for SSH2               hmac-md5,hmac-sha1,hmac-ripemd160,hmac-ripemd160@openssh.com,hmac-sha1-96,hmac
Supported encryption mac for SSH2               hmac-md5,hmac-sha1,hmac-ripemd160,hmac-ripemd160@openssh.com,hmac-sha1-96,hmac
Supported authentification methods for SSH2     publickey,gssapi-with-mic,password
```

IMPACT:
Successful exploitation allows an attacker to execute arbitrary commands on the SSH server or otherwise subvert an encrypted SSH channel with arbitrary data.

SOLUTION:
SSH version 2 is preferred over SSH version 1.

RESULT:

SSH1 supported no
SSH2 supported yes
Supported key exchange algorithms for SSH2 curve25519-sha256,curve25519-sha256@libssh.org,ecdh-sha2-nistp256,ecdh-sha2-nistp384,ecdh-sha2-nistp521,sntrup761x25519-sha512@openssh.com,diffie-hellman-group-exchange-sha256,diffie-hellman-group16-sha512,diffie-hellman-group18-sha512,diffie-hellman-group14-sha256,kex-strict-s-v00@openssh.com

QID:	82046
Category:	TCP/IP
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2006-07-27 21:45:19.0

THREAT:

The values for the identification (ID) field in IP headers in IP packets from the host are analyzed to determine how random they are. The changes between subsequent ID values for either the network byte ordering or the host byte ordering, whichever is smaller, are displayed in the RESULT section along with the duration taken to send the probes. When incremental values are used, as is the case for TCP/IP implementation in many operating systems, these changes reflect the network load of the host at the time this test was conducted.

Please note that for reliability reasons only the network traffic from open TCP ports is analyzed.

IMPACT:

N/A

SOLUTION:

N/A

RESULT:

IP ID changes observed (network order) for port 22: 0 0 0

THREAT:
Scan activity per port is an estimate of the amount of internal process time the scanner engine spent scanning a particular TCP or UDP port. This information can be useful to determine the reason for long scan times. The individual time values represent internal process time, not elapsed time, and can be longer than the total scan time because of internal parallelism. High values are often caused by slowly responding services or services on which requests time out.

IMPACT:

Category:	Web server
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2006-07-11 16:04:25.0

THREAT:
Apache installs foreign language files along with index.html. The files are as follows:

index.html.ca
index.html.de
index.html.dk
index.html.ee

An attacker can get additional information about the Web server from these files.

IMPACT:
Sensitive system information may be disclosed, which can be utilized by an attacker to aid further attacks.

SOLUTION:
Apache recommends to remove these files from the Web server.

Referrer-Policy HTTP Security Header Not Detected — port 80 / tcp

PCI COMPLIANCE STATUS

PASS

VULNERABILITY DETAILS

Severity:	1
QID:	48131

Category:	Information gathering
CVE ID:	-
Vendor Reference:	Referrer-Policy
Bugtraq ID:	-
Last Update:	2023-01-18 13:30:16.0

THREAT:
No Referrer Policy is specified for the link. It checks for one of the following Referrer Policy in the response headers:

1) no-referrer
2) no-referrer-when-downgrade
3) same-origin
4) origin
5) origin-when-cross-origin
6) strict-origin
7) strict-origin-when-cross-origin

QID Detection Logic(Unauthenticated):
If the Referrer Policy header is not found , checks in response body for meta tag containing tag name as "referrer" and one of the above Referrer Policy.

IMPACT:
The Referrer-Policy header controls how much referrer information is sent to a site when navigating to it. Absence of Referrer-Policy header can lead to leakage of sensitive information via the referrer header.

SOLUTION:
Referrer Policy header improves security by ensuring websites don't leak sensitive information via the referrer header. It's recommended to add secure Referrer Policies as a part of a defense-in-depth approach.

References:

QID:	48259
Category:	Information gathering
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2024-07-03 11:01:23.0

THREAT:
The ChaCha20-Poly1305 algorithm and the CBC-EtM algorithm are known to be vulnerable to the SSH Prefix Truncation Vulnerability (Terrapin).

QID Detection Logic (Unauthenticated):
This detection attempts to start the SSH key exchange process and examines whether either of the vulnerable ChaCha20-Poly1305 Algorithm or CBC-EtM Algorithm is active. Please note that this is an Information Gathering QID and does not check if a target is vulnerable, as this does not checks for Strict Key Exchange. Customers are advised to refer to QID 38913 to detect vulnerable assets.

IMPACT:
The algorithms are known to be vulnerable to the SSH Prefix Truncation Vulnerability (Terrapin). Successful exploitation of the vulnerability may allow an attacker to downgrade the security of an SSH connection when using SSH extension negotiation. The impact in practice heavily depends on the supported extensions. Most commonly, this will impact the security of client authentication when using an RSA public key.

SOLUTION:
N/A

RESULT:
SSH Algorithms ChaCha20-Poly1305 or CBC-EtM detected on port: 22

CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2024-12-19 13:22:09.0

THREAT:
The port scanner enables unauthorized users with the appropriate tools to draw a map of all services on this host that can be accessed from the Internet. The test was carried out with a "stealth" port scanner so that the server does not log real connections.

The Results section displays the port number (Port), the default service listening on the port (IANA Assigned Ports/Services), the description of the service (Description) and the service that the scanner detected using service discovery (Service Detected).

IMPACT:
Unauthorized users can exploit this information to test vulnerabilities in each of the open services.

SOLUTION:
Shut down any unknown or unused service on the list. If you have difficulty figuring out which service is provided by which process or program, contact your provider's support team. For more information about commercial and open-source Intrusion Detection Systems available for detecting port scanners of this kind, visit the CERT Web site.

Category:	General remote services
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2019-02-07 10:57:24.0

THREAT:

Memcached is a general-purpose distributed memory caching system. It is often used to speed up dynamic database-driven websites by caching data and objects in RAM to reduce the number of times an external data source must be read.

The target is running Memcached service with authentication disabled.

QID Detection Logic (Unauthenticated):
This QID sends a crafted TCP packet to the target memcached service to check it's accessible without any authentication.

IMPACT:

An unauthenticated, remote attacker could exploit this vulnerability to retrieve sensitive information.

SOLUTION:

Customers are advised to enable authentication for memcached service.

Memcached Insecure Configuration Vulnerability

PCI COMPLIANCE STATUS

Category:	General remote services
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2019-05-17 06:30:27.0

THREAT:

Memcached is a high performance, distributed memory object caching system intended for use in speeding up dynamic Web applications by alleviating database load.

By default, it serves on TCP port 11211.

Memcached does not effectively ensure defensibility from random Internet connections. Insecure configuration might expose Memcached directly to the Internet, causing leakage of confidential information.

IMPACT:

By exploiting this vulnerability, an attacker can gain confidential information of the target.

SOLUTION:

Workaround:

1. In a local environment, an administrator can employ parameter "-l 127.0.0.1" to disallow connection from other hosts.
2. In a distributed network environment, a firewall must be configured to protect the Memcached listening port from untrusted connections.

For more information about secure configuration, please refer to Memcached Wiki.

QID:	11827
Category:	CGI
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2025-01-02 19:23:28.0

THREAT:
This QID reports the absence of the following HTTP headers according to CWE-693: Protection Mechanism Failure:
X-Content-Type-Options: This HTTP header will prevent the browser from interpreting files as a different MIME type to what is specified in the Content-Type HTTP header.
Strict-Transport-Security: The HTTP Strict-Transport-Security response header (HSTS) allows web servers to declare that web browsers (or other complying user agents) should only interact with it using secure HTTPS connections, and never via the insecure HTTP protocol.

QID Detection Logic:
This unauthenticated QID will send a GET request sent to '/' (default) endpoint and looks for the presence of the following HTTP Headers in the received response:
The Valid directives are as belows: X-Content-Type-Options: nosniff

Strict-Transport-Security: max-age=< [;includeSubDomains]
IMPACT:
Depending on the vulnerability being exploited, an unauthenticated remote attacker could conduct cross-site scripting, clickjacking or MIME-type sniffing attacks.

SOLUTION:
Note: To better debug the results of this QID, it is requested that customers execute commands to simulate the following functionality: curl -lkL --verbose.

CWE-693: Protection Mechanism Failure mentions the following - The product does not use or incorrectly uses a protection mechanism that provides sufficient defense against directed attacks against the product. A "missing" protection mechanism occurs when the application does not define any mechanism against a certain class of attack. An "insufficient" protection mechanism might provide some defenses - for example, against the most common attacks - but it does not protect against everything that is intended. Finally, an "ignored" mechanism occurs when a mechanism is available and in active use within the product, but the developer has not applied it in some code path.

Customers are advised to set proper X-Content-Type-Options and Strict-Transport-Security HTTP response headers.

Depending on their server software, customers can set directives in their site configuration or Web.config files. Few examples are:

X-Content-Type-Options:
Apache: Header always set X-Content-Type-Options: nosniff

HTTP Strict-Transport-Security:
Apache: Header always set Strict-Transport-Security "max-age=31536000; includeSubDomains"
Nginx: add_header Strict-Transport-Security max-age=31536000;

Note: Network devices that include a HTTP/HTTPS console for administrative/management purposes often do not include all/some of the security headers. This is a known issue and it is recommend to contact the vendor for a solution.
RESULT:
X-Content-Type-Options HTTP Header missing on port 80.

Configuration Overview
</div>
<div class="content_section_text">
<p>
Ubuntu&apos;s Apache2 default configuration is different from the
upstream default configuration, and split into several files optimized for
interaction with Ubuntu tools. The configuration system is
<b>fully documented in
/usr/share/doc/apache2/README.Debian.gz</b>. Refer to this for the full
documentation. Documentation for the web server itself can be
found by accessing the <a href="/manual">manual</a> if the <tt>apache2-doc</tt>
package was installed on this server.
</p>
<p>
```

The configuration layout for an Apache2 web server installation on Ubuntu systems is as follows:
</p>
<pre>
/etc/apache2/
|-- apache2.conf
| `-- ports.conf
|-- mods-enabled
| |-- *.load
| `-- *.conf
|-- conf-enabled
| `-- *.conf
|-- sites-enabled
| `-- *.conf
</pre>

<tt>apache2.conf</tt> is the main configuration
file. It puts the pieces together by including all remaining configuration
files when starting up the web server.

<tt>ports.conf</tt> is always included from the
main configuration file. It is used to determine the listening ports for
incoming connections, and this file can be customized anytime.

Configuration files in the <tt>mods-enabled/</tt>,
<tt>conf-enabled/</tt> and <tt>sites-enabled/</tt> directories contain
particular configuration snippets which manage modules, global configuration
fragments, or virtual host configurations, respectively.

They are activated by symlinking available
configuration files from their respective
*-available/ counterparts. These should be managed
by using our helpers
<tt>
a2enmod,
a2dismod,
</tt>
<tt>
a2ensite,
a2dissite,
</tt>
and
<tt>
a2enconf,
a2disconf
</tt>. See their respective man pages for detailed information.

The binary is called apache2 and is managed using systemd, so to

start/stop the service use <tt>systemctl start apache2</tt> and
<tt>systemctl stop apache2</tt>, and use <tt>systemctl status apache2</tt>
and <tt>journalctl -u apache2</tt> to check status. <tt>system</tt>
and <tt>apache2ctl</tt> can also be used for service management if
desired.
Calling <tt>/usr/bin/apache2</tt> directly will not work with the
default configuration.

Document Roots

By default, Ubuntu does not allow access through the web browser to
any file outside of those located in <tt>/var/www</tt>,
public_html
directories (when enabled) and <tt>/usr/share</tt> (for web
applications). If your site is using a web document root
located elsewhere (such as in <tt>/srv</tt>) you may need to whitelist your
document root directory in <tt>/etc/apache2/apache2.conf</tt>.

The default Ubuntu document root is <tt>/var/www/html</tt>. You
can make your own virtual hosts under /var/www.

Reporting Problems

Please use the <tt>ubuntu-bug</tt> tool to report bugs in the
Apache2 package with Ubuntu. However, check <a
href="https://bugs.launchpad.net/ubuntu/+source/apache2"
rel="nofollow">existing bug reports before reporting a new bug.

Please report bugs specific to modules (such as PHP and others)
to their respective packages, not to the web server itself.

TCP Sequence Number Approximation Based Denial of Service

PCI COMPLIANCE STATUS

PCI Severity Level: MED

PASS

The vulnerability is purely a denial-of-service (DoS) vulnerability.

VULNERABILITY DETAILS

CVSS Base Score:	**5.0** AV:N/AC:L/Au:N/C:N/I:N/A:P
CVSS Temporal Score:	**4.3** E:F/RL:T/RC:C
Severity:	**3**
QID:	82054
Category:	TCP/IP
CVE ID:	CVE-2004-0230
Vendor Reference:	-
Bugtraq ID:	10183
Last Update:	2024-02-29 00:00:01.0

THREAT:

TCP provides stateful communications between hosts on a network. TCP sessions are established by a three-way handshake and use random 32-bit sequence and acknowledgement numbers to ensure the validity of traffic. A vulnerability was reported that may permit TCP sequence numbers to be more easily approximated by remote attackers. This issue affects products released by multiple vendors.

The cause of the vulnerability is that affected implementations will accept TCP sequence numbers within a certain range, known as the acknowledgement range, of the expected sequence number for a packet in the session. This is determined by the TCP window size, which is negotiated during the three-way handshake for the session. Larger TCP window sizes may be set to allow for more throughput, but the larger the TCP window size, the more probable it is to guess a TCP sequence number that falls within an acceptable range. It was initially thought that guessing an acceptable sequence number was relatively difficult for most implementations given random distribution, making this type of attack impractical. However, some implementations may make it easier to successfully approximate an acceptable TCP sequence number, making these attacks possible with a number of protocols and implementations.

This is further compounded by the fact that some implementations may support the use of the TCP Window Scale Option, as described in RFC 1323, to extend the TCP window size to a maximum value of 1 billion.

This vulnerability will permit a remote attacker to inject a SYN or RST packet into the session, causing it to be reset and effectively allowing for denial of service attacks. An attacker would exploit this issue by sending a packet to a receiving implementation with an approximated sequence number and a forged source IP address and TCP port.

There are a few factors that may present viable target implementations, such as those which depend on long-lived TCP connections, those that have known or easily guessed IP address endpoints and those implementations with easily guessed TCP source ports. It has been noted that Border Gateway Protocol (BGP) is reported to be particularly vulnerable to this type of attack, due to the use of long-lived TCP sessions and the possibility that some implementations may use the TCP Window Scale Option. As a result, this issue is likely to affect a number of routing platforms.

Another factor to consider is the relative difficulty of injecting packets into TCP sessions, as a number of receiving implementations will reassemble packets in order, dropping any duplicates. This may make some implementations more resistant to attacks than others.

It should be noted that while a number of vendors have confirmed this issue in various products, investigations are ongoing and it is likely that many other vendors and products will turn out to be vulnerable as the issue is investigated further.

IMPACT:

Successful exploitation of this issue could lead to denial of service attacks on the TCP based services of target hosts.

SOLUTION:

Please first check the results section below for the port number on which this vulnerability was detected. If that port number is known to be used for port-forwarding, then it is the backend host that is really vulnerable.

Various implementations and products including Check Point, Cisco, Cray Inc, Hitachi, Internet Initiative Japan, Inc (IIJ), Juniper Networks, NEC and Yamaha are currently undergoing review. Contact the vendors to obtain more information about affected products and fixes. NISCC Advisory 236929 - Vulnerability Issues in TCP details the vendor patch status as of the time of the advisory, and identifies resolutions and workarounds.

Refer to US-CERT Vulnerability Note VU#415294 and OSVDB Article 4030 to obtain a list of vendors affected by this issue and a note on resolutions (if any) provided by the vendor.

For Microsoft: Refer to MS05-019 and MS06-064 for further details.

For SGI IRIX: Refer to SGI Security Advisory 20040905-01-P

For SCO UnixWare 7.1.3 and 7.1.1: Refer to SCO Security Advisory SCOSA-2005.14

For Solaris (Sun Microsystems): The vendor has acknowledged the vulnerability; however a patch is not available. Refer to Sun Microsystems, Inc. Information for VU#415294 to obtain additional details. Also, refer to TA04-111A for detailed mitigating strategies against these attacks.

For NetBSD: Refer to NetBSD-SA2004-006

For Cisco: Refer to cisco-sa-20040420-tcp-ios.shtml.

For IBM : Refer to IBM-tcp-sequence-number-cve-2004-0230.

For Red Hat Linux: There is no fix available : Refer to .

Workaround:
The following BGP-specific workaround information has been provided.

For BGP implementations that support it, the TCP MD5 Signature Option should be enabled. Passwords that the MD5 checksum is applied to should be set to strong values and changed on a regular basis.

Secure BGP configuration instructions have been provided for Cisco and Juniper at these locations:
Secure Cisco IOS BGP Template
JUNOS Secure BGP Template

RESULT:
Tested on port 80 with an injected SYN/RST offset by 16 bytes.

THREAT:

The SSH protocol (Secure Shell) is a method for secure remote login from one computer to another. The target is using deprecated SHA1 cryptographic settings to communicate.

IMPACT:

vulnerable to collision attacks, which are designed to fabricate the same hash value for different input data.each hash is supposedly unique.

SOLUTION:

Avoid using deprecated cryptographic settings.

Use best practices when configuring SSH.

CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2024-08-03 05:00:01.0

THREAT:

Reverse Tabnabbing is an attack where the target page is replaced by phishing site. This is possible when target="_blank" is in use with rel="noopener" or rel="noreferrer", attacker can use JavaScript window.opener and inject malicious domain in it. When user clicks on html link, they will get redirected to phishing or unintentional website.

WAS detects this vulnerability during crawling and evaluates HTML links embedded in anchor tags.

IMPACT:

The user may be redirected to an untrusted page that contains undesired content or malicious script code.

SOLUTION:

Use either of these attributes rel="noreferrer" or rel="noopener".

Implement Cross Origin Opener Policy header.

OpenSSH Sensitive Information Disclosure Vulnerability — port 22 / tcp

PCI COMPLIANCE STATUS

PCI Severity Level: HIGH

FAIL

VULNERABILITY DETAILS

CVSS Base Score:	**7.5** AV:N/AC:L/Au:N/C:P/I:P/A:P
CVSS Temporal Score:	**5.5** E:U/RL:OF/RC:C
Severity:	**5**
QID:	38896
Category:	General remote services
CVE ID:	CVE-2023-28531
Vendor Reference:	OpenSSH Advisory
Bugtraq ID:	-
Last Update:	2024-12-11 13:21:59.0

THREAT:
OpenSSH (OpenBSD Secure Shell) is a set of computer programs providing encrypted communication sessions over a computer network using the SSH protocol.

Affected Versions:
OpenSSH version 8.9 and above prior to 9.3

QID Detection Logic:
This unauthenticated detection works by reviewing the version of the OpenSSH service.

IMPACT:
Successfully exploitation of this vulnerability could lead to disclosure of sensitive information, addition or modification of data, or Denial of Service (DoS).

SOLUTION:
Customers are advised to upgrade to OpenSSH 9.3 or later to remediate these vulnerabilities.

Patch:
Following are links for downloading patches to fix the vulnerabilities:

Vendor Reference:	Apache_http_server
Bugtraq ID:	-
Last Update:	2024-08-20 12:27:20.0

THREAT:
Apache HTTP Server is an HTTP web server application.

CVE-2022-28330: Apache HTTP Server 2.4.53 and earlier on Windows may read beyond bounds when configured to process requests with the mod_isapi module.
CVE-2022-28614: The ap_rwrite() function in Apache HTTP Server 2.4.53 and earlier may read unintended memory if an attacker can cause the server to reflect very large input using ap_rwrite() or ap_rputs(), such as with mod_luas r:puts() function.
CVE-2022-28615: Apache HTTP Server 2.4.53 and earlier may crash or disclose information due to a read beyond bounds in ap_strcmp_match() when provided with an extremely large input buffer.
CVE-2022-29404: In Apache HTTP Server 2.4.53 and earlier, a malicious request to a lua script that calls r:parsebody(0) may cause a denial of service due to no default limit on possible input size.
CVE-2022-30556: Apache HTTP Server 2.4.53 and earlier may return lengths to applications calling r:wsread() that point past the end of the storage allocated for the buffer.

Affected Versions:
Apache HTTP Server versions 2.4.53 and earlier

QID Detection Logic:(Unauthenticated)
This QID checks for server banners to detect if the target is running the vulnerable version of apache httpd.
IMPACT:
Successful exploitation of this vulnerability may compromise Confidentiality, Integrity, and Availability of the Data.
SOLUTION:
Customers are advised to update latest Apache httpd

Last Update:	2024-09-06 06:03:24.0

THREAT:
Apache HTTP Server is an HTTP web server application.

CVE-2022-36760: Inconsistent Interpretation of HTTP Requests ('HTTP Request Smuggling') vulnerability in mod_proxy_ajp of Apache HTTP Server allows an attacker to smuggle requests to the AJP server it forwards requests to.

Affected Versions:
Apache HTTP Server from 2.4 through 2.4.54

QID Detection Logic:(Unauthenticated)
This QID checks for server banner to detect if the target is running vulnerable version of apache httpd.

IMPACT:
Successful exploitation of this vulnerability allows an attacker to smuggle requests to the AJP server it forwards requests.

THREAT:
Apache HTTP Server is an HTTP web server application.

CVE-2006-20001: A carefully crafted If: request header can cause a memory read, or write of a single zero byte, in a pool (heap) memory location beyond the header value sent. This could cause the process to crash.
CVE-2022-37436: A malicious backend can cause the response headers to be truncated early, resulting in some headers being incorporated into the response body. If the later headers have any security purpose, they will not be interpreted by the client.

Affected Versions:
Apache HTTP Server versions prior to 2.4.55

QID Detection Logic:(Unauthenticated)
This QID checks for server banner to detect if the target is running vulnerable version of apache httpd.

IMPACT:

Successful exploitation of this vulnerability may result in the breach of Confidentiality, Integrity, and Availability of data.

CVE ID:	CVE-2023-25690
Vendor Reference:	Apache HTTP Server Security Advisory
Bugtraq ID:	-
Last Update:	2024-12-30 13:21:09.0

THREAT:

Some mod_proxy configurations on Apache HTTP Server versions 2.4.0 through 2.4.55 allow a HTTP Request Smuggling attack.

Configurations are affected when mod_proxy is enabled along with some form of RewriteRule or ProxyPassMatch in which a non-specific pattern matches some portion of the user-supplied request-target (URL) data and is then re-inserted into the proxied request-target using variable substitution.

Affected Versions:
Apache HTTP Server Versions 2.4.0 through 2.4.55 (including)

QID Detection Logic(Unauthenticated):
This QID checks for vulnerable version of Apache HTTP Server by sending a GET request to a target and extracting the version from the response header.

IMPACT:
Request splitting/smuggling could result in bypass of access controls in the proxy server, proxying unintended URLs to existing origin servers, and cache poisoning.
SOLUTION:
Customers are advised to upgrade to Apache HTTP Server version 2.4.56 or later. For more information please refer to Apache HTTP Server Security Advisory

CVE ID:	CVE-2024-40898
Vendor Reference:	Apache HTTP Server
Bugtraq ID:	-
Last Update:	2024-11-13 18:02:42.0

THREAT:
Apache HTTP Server, colloquially called Apache, is a free and open-source cross-platform web server software.

Multiple versions of Apache HTTP Server on Windows are affected by a Server-Side Request Forgery (SSRF) Vulnerability with mod_rewrite in server/vhost context.

Affected Versions:
Apache HTTP Server versions from 2.4.0 prior to 2.4.62

QID Detection Logic (Unauthenticated):
This QID sends an HTTP GET request and checks the HTTP response headers to confirm if the host is running vulnerable version of Apache HTTP Server.

IMPACT:
Successful exploitation of this vulnerability could potentially leak NTML hashes to a malicious server via SSRF and malicious requests.
SOLUTION:
Customers are advised to upgrade to Apache HTTP Server 2.4.62 or later version to remediate this vulnerability. For more information related to this vulnerability please refer to Apache HTTP Server Security.

Category:	CGI
CVE ID:	CVE-2006-20001, CVE-2022-37436
Vendor Reference:	Apache_http_server
Bugtraq ID:	-
Last Update:	2024-08-20 12:27:20.0

THREAT:
Apache HTTP Server is an HTTP web server application.

CVE-2006-20001: A carefully crafted If: request header can cause a memory read, or write of a single zero byte, in a pool (heap) memory location beyond the header value sent. This could cause the process to crash.
CVE-2022-37436: A malicious backend can cause the response headers to be truncated early, resulting in some headers being incorporated into the response body. If the later headers have any security purpose, they will not be interpreted by the client.

Affected Versions:
Apache HTTP Server versions prior to 2.4.55

QID Detection Logic:(Unauthenticated)
This QID checks for server banner to detect if the target is running vulnerable version of apache httpd.
IMPACT:
Successful exploitation of this vulnerability may result in the breach of Confidentiality, Integrity, and Availability of data.
SOLUTION:
Customers are advised to update the latest Apache HTTP Server versions 2.4.55 or later.
For further information, please refer to Apache HTTP Server Security Advisory.

Vendor Reference:	OpenSSH 9.6
Bugtraq ID:	-
Last Update:	2024-12-11 13:21:59.0

THREAT:
OpenSSH is a set of computer programs providing encrypted communication sessions over a computer network using the SSH protocol.

In OpenSSH, when common types of DRAM are used, might allow row hammer attacks (for authentication bypass) because the integer value of authenticated in mm_answer_authpassword does not resist flips of a single bit.

Affected Versions:
OpenSSH up to version 9.6

QID Detection Logic:
This unauthenticated detection works by reviewing the version of the OpenSSH service.
IMPACT:
Successful exploitation allows OS command injection and row hammer attacks for authentication bypass.
SOLUTION:
There are no vendor supplied patches available at this time.

Vendor Reference:	Apache HTTP Server
Bugtraq ID:	-
Last Update:	2024-12-13 12:00:01.0

THREAT:

The Apache HTTP Server, colloquially called Apache, is a free and open-source cross-platform web server software.

Affected versions of Apache HTTP Server has multiple vulnerabilities:

DoS by Null pointer in websocket over HTTP/2 (CVE-2024-36387): Serving WebSocket protocol upgrades over a HTTP/2 connection could result in a Null Pointer dereference, leading to a crash of the server process, degrading performance.

Windows UNC SSRF (CVE-2024-38472): SSRF in Apache HTTP Server on Windows allows to potentially leak NTML hashes to a malicious server via SSRF and malicious requests or content.
Note: Existing configurations that access UNC paths will have to configure new directive "UNCList" to allow access during request processing.

Proxy encoding problem (CVE-2024-38473): Encoding problem in mod_proxy allows request URLs with incorrect encoding to be sent to backend services, potentially bypassing authentication via crafted requests.

Weakness with encoded question marks in backreferences (CVE-2024-38474): Substitution encoding issue in mod_rewrite. Allows attacker to execute scripts in directories permitted by the configuration but not directly reachable by any URL or source disclosure of scripts meant to only to be executed as CGI.

Weakness in mod_rewrite when first segment of substitution matches filesystem path. (CVE-2024-38475): Improper escaping of output in mod_rewrite. Allows an attacker to map URLs to filesystem locations that are permitted to be served by the server but are not intentionally/directly reachable by any URL, resulting in code execution or source code disclosure.

Crash resulting in Denial of Service in mod_proxy via a malicious request (CVE-2024-38477): null pointer dereference in mod_proxy. Allows an attacker to crash the server via a malicious request.

mod_rewrite proxy handler substitution (CVE-2024-39573): Potential SSRF in mod_rewrite. Allows an attacker to cause unsafe RewriteRules to unexpectedly setup URLs to be handled by mod_proxy.

Affected Versions:
Apache HTTP Server version from 2.4.0 to 2.4.59

QID Detection Logic (Unauthenticated):
This QID sends a HTTP GET request and checks the response headers to confirm if the host is running vulnerable version of Apache HTTP Server.
IMPACT:
Successful exploitation of this vulnerability could lead to a security breach or could affect integrity, availability, and confidentiality.
SOLUTION:
Customers are advised to upgrade to the latest version of Apache HTTP Server to remediate this vulnerability. For more information related to this vulnerability please refer to Apache's Security advisory

CVE ID:	CVE-2023-25690
Vendor Reference:	Apache HTTP Server Security Advisory
Bugtraq ID:	-
Last Update:	2024-12-30 13:21:09.0

THREAT:

Some mod_proxy configurations on Apache HTTP Server versions 2.4.0 through 2.4.55 allow a HTTP Request Smuggling attack.

Configurations are affected when mod_proxy is enabled along with some form of RewriteRule or ProxyPassMatch in which a non-specific pattern matches some portion of the user-supplied request-target (URL) data and is then re-inserted into the proxied request-target using variable substitution.

Affected Versions:
Apache HTTP Server Versions 2.4.0 through 2.4.55 (including)

QID Detection Logic(Unauthenticated):
This QID checks for vulnerable version of Apache HTTP Server by sending a GET request to a target and extracting the version from the response header.

IMPACT:

Request splitting/smuggling could result in bypass of access controls in the proxy server, proxying unintended URLs to existing origin servers, and cache poisoning.

SOLUTION:

Customers are advised to upgrade to Apache HTTP Server version 2.4.56 or later. For more information please refer to Apache HTTP Server Security Advisory

CVE ID:	CVE-2022-26377
Vendor Reference:	Apache_http_server
Bugtraq ID:	-
Last Update:	2024-08-20 12:27:20.0

THREAT:
Apache HTTP Server is an HTTP web server application.

CVE-2022-26377: Inconsistent Interpretation of HTTP Requests ('HTTP Request Smuggling') vulnerability in mod_proxy_ajp of Apache HTTP Server allows an attacker to smuggle requests to the AJP server it forwards requests to.

Affected Versions:
Apache HTTP Server versions 2.4 to 2.4.53

QID Detection Logic:(Unauthenticated)
This QID checks for server banners to detect if the target is running vulnerable version of apache httpd.

IMPACT:
Successful exploitation of this vulnerability may allows an attacker to smuggle requests to the AJP server it forwards requests to.

SOLUTION:
Customers are advised to update latest Apache httpd

Vendor Reference:	Apache HTTP Server
Bugtraq ID:	-
Last Update:	2024-12-13 12:00:01.0

THREAT:
The Apache HTTP Server, colloquially called Apache, is a free and open-source cross-platform web server software.

Affected versions of Apache HTTP Server has multiple vulnerabilities:

DoS by Null pointer in websocket over HTTP/2 (CVE-2024-36387): Serving WebSocket protocol upgrades over a HTTP/2 connection could result in a Null Pointer dereference, leading to a crash of the server process, degrading performance.

Windows UNC SSRF (CVE-2024-38472): SSRF in Apache HTTP Server on Windows allows to potentially leak NTML hashes to a malicious server via SSRF and malicious requests or content.
Note: Existing configurations that access UNC paths will have to configure new directive "UNCList" to allow access during request processing.

Proxy encoding problem (CVE-2024-38473): Encoding problem in mod_proxy allows request URLs with incorrect encoding to be sent to backend services, potentially bypassing authentication via crafted requests.

Weakness with encoded question marks in backreferences (CVE-2024-38474): Substitution encoding issue in mod_rewrite. Allows attacker to execute scripts in directories permitted by the configuration but not directly reachable by any URL or source disclosure of scripts meant to only to be executed as CGI.

Weakness in mod_rewrite when first segment of substitution matches filesystem path. (CVE-2024-38475): Improper escaping of output in mod_rewrite. Allows an attacker to map URLs to filesystem locations that are permitted to be served by the server but are not intentionally/directly reachable by any URL, resulting in code execution or source code disclosure.

Crash resulting in Denial of Service in mod_proxy via a malicious request (CVE-2024-38477): null pointer dereference in mod_proxy. Allows an attacker to crash the server via a malicious request.

mod_rewrite proxy handler substitution (CVE-2024-39573): Potential SSRF in mod_rewrite. Allows an attacker to cause unsafe RewriteRules to unexpectedly setup URLs to be handled by mod_proxy.

Affected Versions:
Apache HTTP Server version from 2.4.0 to 2.4.59

QID Detection Logic (Unauthenticated):
This QID sends a HTTP GET request and checks the response headers to confirm if the host is running vulnerable version of Apache HTTP Server.
IMPACT:
Successful exploitation of this vulnerability could lead to a security breach or could affect integrity, availability, and confidentiality.
SOLUTION:
Customers are advised to upgrade to the latest version of Apache HTTP Server to remediate this vulnerability. For more information related to this vulnerability please refer to Apache's Security advisory

QID Detection Logic (Unauthenticated):
This QID sends a HTTP GET request and checks the response headers to confirm if the host is running vulnerable version of Apache HTTP Server.
IMPACT:
Exploitation of the vulnerability could lead to uncontrolled resource consumption or buffer over-read.

SOLUTION:

Customers are advised to upgrade to the latest version of Apache HTTP Server to remediate this vulnerability. For more information related to this vulnerability please refer to Apache's Security advisory

Vendor Reference:	Apache HTTP Server 2.4 vulnerabilities
Bugtraq ID:	-
Last Update:	2024-06-02 12:01:45.0

THREAT:

The Apache HTTP Server, colloquially called Apache, is a free and open-source cross-platform web server software.

Affected versions of Apache HTTP Server has multiple vulnerabilities:
CVE-2023-31122 : Out-of-bounds Read vulnerability in mod_macro of Apache HTTP Server
CVE-2023-43622 : DoS in HTTP/2 with initial windows size 0

CVE-2023-45802 : When a HTTP/2 stream was reset (RST frame) by a client, there was a time window were the requests memory resources were not reclaimed immediately. Instead, de-allocation was deferred to connection close. A client could send new requests and resets, keeping the connection busy and open and causing the memory footprint to keep on growing. On connection close, all resources were reclaimed, but the process might run out of memory before that.

Affected Versions:
Apache HTTP Server version from 2.4.0 to 2.4.57

QID Detection Logic (Unauthenticated):
This QID sends a HTTP GET request and checks the response headers to confirm if the host is running vulnerable version of Apache HTTP Server.

THREAT:
Web server default page are common generic pages, including documentation and allow access to common configuration paths.

QID Detection Logic:
This QID checks for the web server by sending a GET request and checking the response body.
QID identifies Apache Web Server Default pages.

IMPACT:
When common default pages are exposed, version information about servers can be revealed. Attackers use this information to identify any known weaknesses and exploit.

SOLUTION:
Create custom default pages.
Disable or remove known/default web pages.

Category:	General remote services
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2024-05-20 12:30:20.0

THREAT:
A remote access or remote management service was detected. If such a service is accessible to malicious users it can be used to carry different type of attacks. Malicious users could try to brute force credentials or collect additional information on the service which could enable them in crafting further attacks.

The Results section includes information on the remote access service that was found on the target.

Services like Telnet, Rlogin, SSH, windows remote desktop, pcAnywhere, Citrix Management Console, Remote Admin (RAdmin), VNC, OPENVPN and ISAKMP are checked.

IMPACT:
Consequences vary by the type of attack.

SOLUTION:
Expose the remote access or remote management services only to the system administrators or intended users of the system.

RESULT:
Service name: SSH on TCP port 22.

CVE ID:	-

THREAT:
Common file paths such as /var/www/. /var/lib/www, /usr/local/apache2, /Inetpub/wwwroot, /usr/share, etc are default web directory paths. Using such paths or directory structure and leaking information in web application leads to information disclosure about directory paths and framework in use.

IMPACT:
Public-facing web pages and code, products may store sensitive data, code that is not directly invoked, or other files under the web document root of the web server. If the server is not configured or otherwise used to prevent direct access to those files, then attackers may obtain this sensitive data. Default directory paths often have meta data, configuration files that can be read or written by a public or anonymous user.

SOLUTION:
Avoid using common web directory paths and use virtual directories.

RESULT:
Default Web Directory Path Found.

Last Update:	2025-02-11 13:32:02.0

THREAT:
Several different techniques can be used to identify the operating system (OS) running on a host. A short description of these techniques is provided below. The specific technique used to identify the OS on this host is included in the RESULTS section of your report.

1) **TCP/IP Fingerprint**: The operating system of a host can be identified from a remote system using TCP/IP fingerprinting. All underlying operating system TCP/IP stacks have subtle differences that can be seen in their responses to specially-crafted TCP packets. According to the results of this "fingerprinting" technique, the OS version is among those listed below.

Note that if one or more of these subtle differences are modified by a firewall or a packet filtering device between the scanner and the host, the fingerprinting technique may fail. Consequently, the version of the OS may not be detected correctly. If the host is behind a proxy-type firewall, the version of the operating system detected may be that of the firewall instead of the host being scanned.

2) **NetBIOS**: Short for Network Basic Input Output System, an application programming interface (API) that augments the DOS BIOS by adding special functions for local-area networks (LANs). Almost all LANs for PCs are based on the NetBIOS. Some LAN manufacturers have even extended it, adding additional network capabilities. NetBIOS relies on a message format called Server Message Block (SMB).

3) **PHP Info**: PHP is a hypertext pre-processor, an open-source, server-side, HTML-embedded scripting language used to create dynamic Web pages. Under some configurations it is possible to call PHP functions like phpinfo() and obtain operating system information.

4) **SNMP**: The Simple Network Monitoring Protocol is used to monitor hosts, routers, and the networks to which they attach. The SNMP service maintains Management Information Base (MIB), a set of variables (database) that can be fetched by Managers. These include "MIB_II.system.sysDescr" for the operating system.

Host Uptime Based on TCP TimeStamp Option

PCI COMPLIANCE STATUS

Category:	TCP/IP
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2007-05-29 18:56:36.0

THREAT:
The TCP/IP stack on the host supports the TCP TimeStamp (kind 8) option. Typically the timestamp used is the host's uptime (since last reboot) in various units (e.g., one hundredth of second, one tenth of a second, etc.). Based on this, we can obtain the host's uptime. The result is given in the Result section below.

Some operating systems (e.g., MacOS, OpenBSD) use a non-zero, probably random, initial value for the timestamp. For these operating systems, the uptime obtained does not reflect the actual uptime of the host; the former is always larger than the latter.

IMPACT:
N/A

SOLUTION:
N/A

RESULT:
Based on TCP timestamps obtained via port 22, the host's uptime is 37 days, 14 hours, and 45 minutes.
The TCP timestamps from the host are in units of 1 milliseconds.

Category:	Web Application

CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2025-02-08 02:07:37.0

THREAT:

The following are some of the possible reasons for the timeouts or connection errors:

1. A disturbance in network connectivity between the scanner and the application occurred.
2. The web server or application server hosting the application was taken down in the midst of a scan.
3. The web application experienced an overload, possibly due to load generated by the scan.
4. An error occurred in the SSL/TLS handshake (applies to HTTPS web applications only).
5. A security device, such as an IDS/IPS or web application firewall (WAF), began to drop or reject the HTTP connections from the scanner.
6. Very large files like PDFs, videos, etc. are present on the site and caused timeouts when accessed by the scanner.

IMPACT:

Some of the resources were not accessible. Results may be incomplete or incorrect.

SOLUTION:

First, confirm that the server was not taken down in the midst of the scan. After that, investigate the root cause by reviewing the listed links and examining web server logs, application server logs, or IDS/IPS/WAF logs. If the errors are caused due to load generated by the scanner then try reducing the scan intensity (this could increase the scan duration). If the errors are due to specific URLs being tested by the scanner or due to specific form data sent by the scanner, then configure exclude lists in the scan configuration as needed to avoid such requests. If timeouts or connection errors are a persistent issue but you want the scan to run to completion, change the Behavior Settings in the option profile to increase the error thresholds or disable the error checks entirely.

RESULT:

Links Rejected By Crawl Scope or Exclusion List — port 443 / tcp

PCI COMPLIANCE STATUS

VULNERABILITY DETAILS

Severity:	1
QID:	150020
Category:	Web Application
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2022-02-07 16:48:28.0

THREAT:
One or more links were not crawled because of an explicit rule to exclude them. This also occurs if a link is malformed.

Exclude list and Include list entries can cause links to be rejected. If a scan is limited to a specific starting directory, then links outside that directory will neither be crawled or tested.

Links that contain a host name or IP address different from the target application are considered external links and not crawled by default; those types of links are not listed here. This often happens when the scope of a scan is limited to the directory of the starting URL. The scope can be changed in the Web Application Record.

During the test phase, some path-based tests may be rejected if the scan is limited to the directory of the starting URL and the test would fall outside that directory. In these cases, the number of rejected links may be too high to list in the Results section.

IMPACT:
Links listed here were neither crawled or tested by the Web application scanning engine.

SOLUTION:
A link might have been intentionally matched by a exclude or include list entry. Verify that no links in this list were unintentionally rejected.

RESULT:
Links not permitted:
(This list includes links from QIDs: 150010,150041,150143,150170)

SSH Algorithms ChaCha20-Poly1305 or CBC-EtM Detected

PCI COMPLIANCE STATUS

PASS

VULNERABILITY DETAILS

Severity:	1
QID:	48259
Category:	Information gathering
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2024-07-03 11:01:23.0

THREAT:
The ChaCha20-Poly1305 algorithm and the CBC-EtM algorithm are known to be vulnerable to the SSH Prefix Truncation Vulnerability (Terrapin).

QID Detection Logic (Unauthenticated):
This detection attempts to start the SSH key exchange process and examines whether either of the vulnerable ChaCha20-Poly1305 Algorithm or CBC-EtM Algorithm is active. Please note that this is an Information Gathering QID and does not check if a target is vulnerable, as this does not checks for Strict Key Exchange. Customers are advised to refer to QID 38913 to detect vulnerable assets.

IMPACT:
The algorithms are known to be vulnerable to the SSH Prefix Truncation Vulnerability (Terrapin). Successful exploitation of the vulnerability may allow an attacker to downgrade the security of an SSH connection when using SSH extension negotiation. The impact in practice heavily depends on the supported extensions. Most commonly, this will impact the security of client authentication when using an RSA public key.

SOLUTION:
N/A

RESULT:
SSH Algorithms ChaCha20-Poly1305 or CBC-EtM detected on port: 22
ChaCha20-Poly1305 Algorithm Support: True
CBC-EtM Algorithm Support: False

Referrer-Policy HTTP Security Header Not Detected — port 4000 / tcp

PCI COMPLIANCE STATUS

PASS

VULNERABILITY DETAILS

Severity:	**1**
QID:	48131
Category:	Information gathering
CVE ID:	-
Vendor Reference:	Referrer-Policy
Bugtraq ID:	-
Last Update:	2023-01-18 13:30:16.0

THREAT:
No Referrer Policy is specified for the link. It checks for one of the following Referrer Policy in the response headers:

1) no-referrer
2) no-referrer-when-downgrade
3) same-origin
4) origin
5) origin-when-cross-origin
6) strict-origin
7) strict-origin-when-cross-origin

QID Detection Logic(Unauthenticated):
If the Referrer Policy header is not found , checks in response body for meta tag containing tag name as "referrer" and one of the above Referrer Policy.

IMPACT:
The Referrer-Policy header controls how much referrer information is sent to a site when navigating to it. Absence of Referrer-Policy header can lead to leakage of sensitive information via the referrer header.

SOLUTION:
Referrer Policy header improves security by ensuring websites don't leak sensitive information via the referrer header. It's recommended to add secure Referrer Policies as a part of a defense-in-depth approach.

References:

Join us on our 1 hour canal tour on our 100% electric, luxury boats.

Enjoy all the beauty that Amsterdam has to offer while enjoying a drink. All our boats have a bar on board where drinks can be bought. During the tour our crew will tell you about the history of Amsterdam and the sights you pass.

During summer, when the weather is mainly sunny and dry, the tour will take place on one of our luxurious open boats. On the other hand, if it happens to be rainy or cold on the canals, we will be very happy to host the tour on one of our beautiful and warm saloon boats.

In order to ensure you a spot on the boat, we advise you to book your ticket online in advanced."><meta _ngcontent-sc104="" itemprop="mpn" content="75227P1"><div _ngcontent-sc104="" itemprop="brand" itemtype="http://schema.org/Brand" itemscope=""><meta _ngcontent-sc104="" itemprop="name" content="Destina holidays"> <div _ngcontent-sc104="" class="col-md-12 no-border"><div _ngcontent-sc104="" class="c_card"><div _ngcontent-sc104="" class="card-img"><img _ngcontent-sc104="" class="img-fluid"> <div _ngcontent-sc104="" class="card-body"><div _ngcontent-sc104="" class="card-title">Flagship Amsterdam Open Boat Canal Cruise - Local live guide with bar on board <div _ngcontent-sc104="" itemprop="aggregateRating" itemtype="http://schema.org/AggregateRating" itemscope="" class="card-subtitle"><span _ngcontent-sc104="" class="pe-1"><i _ngcontent-sc104="" class="fas fa-star checked"></i><span _ngcontent-sc104="" class="pe-1"><i _ngcontent-sc104="" class="fas fa-star checked"></i><span _ngcontent-sc104="" class="pe-1"><i _ngcontent-sc104="" class="fas fa-star checked"></i><span _ngcontent-sc104="" class="pe-1"><i _ngcontent-sc104="" class="fas fa-star checked"></i><span _ngcontent-sc104="" class="pe-1"><i _ngcontent-sc104="" class="fas fa-star checked"></i><!----><!----><span _ngcontent-sc104="" class="gray"> 15407 <meta _ngcontent-sc104="" itemprop="reviewCount" content="15407"><meta _ngcontent-sc104="" itemprop="ratingValue" content="5"> <div _ngcontent-sc104="" class="card-text"><div _ngcontent-sc104="" class="row"><div _ngcontent-sc104="" class="col-md-7"><span _ngcontent-sc104="" class="pe-1"><i _ngcontent-sc104="" class="fal fa-clock"></i> 1 hour <br _ngcontent-sc104=""><i _ngcontent-sc104="" class="far fa-map"></i> Amsterdam <div _ngcontent-sc104="" itemprop="offers" itemtype="http://schema.org/Offer" itemscope="" class="col-md-5 text-end card-price"><link _ngcontent-sc104="" itemprop="url" href="/tours/Netherlands/Amsterdam/75227P1"><meta _ngcontent-sc104="" itemprop="availability" content="https://schema.org/InStock"><meta _ngcontent-sc104="" itemprop="price" content="22"><meta _ngcontent-sc104="" itemprop="offerCount" content="1"><meta _ngcontent-sc104="" itemprop="priceCurrency" content="USD"><meta _ngcontent-sc104="" itemprop="priceValidUntil" content="2026-2-12"><span _ngcontent-sc104="" class="price"> $22 ^{USD} <div _ngcontent-sc104="" class="item"><div _ngcontent-sc104="" itemtype="http://schema.org/Product" itemscope="" class="row no-gutters recommended-card"><meta _ngcontent-sc104="" itemprop="name" content="Flagship Canal Cruise in Classic Boat - Live guide with drinks & Dutch cheese"><link _ngcontent-sc104="" itemprop="image" href="https://media.tacdn.com/media/attractions-splice-spp-674x446/09/3a/8a/80.jpg"><meta _ngcontent-sc104="" itemprop="description" content="On this 1 hour Luxury Classic River Boat Cruise, you will explore the city, its famous landmarks, culture, and rich trading history whilst relaxing with a drink in your hand. Last Update:	2020-10-30 16:31:24.0

THREAT:

Secure Shell is a cryptographic network protocol for operating network services securely over an unsecured network.

QID Detection Logic:

The QID checks for SSH in the banner of the response.

IMPACT:

NA

SOLUTION:

NA

RESULT:

Bugtraq ID:	-
Last Update:	2020-07-27 21:11:30.0

THREAT:
The list of unique links crawled and HTML forms submitted by the scanner appear in the Results section. This list may contain fewer links than the maximum threshold defined.

NOTE: This list also includes:
- All the unique links that are reported in QID 150140 (Redundant links/URL paths crawled and not crawled)
- All the forms reported in QID 150152 (Forms Crawled)
- All the forms in QID 150115 (Authentication Form Found)
- Certain requests from QID 150172 (Requests Crawled)

IMPACT:

Web Server Supports HTTP Request Pipelining — port 80 / tcp

PCI COMPLIANCE STATUS

PASS

VULNERABILITY DETAILS

Severity:	1
QID:	86565
Category:	Web server
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2005-02-23 00:25:38.0

THREAT:
Version 1.1 of the HTTP protocol supports URL-Request Pipelining. This means that instead of using the "Keep-Alive" method to keep the TCP connection alive over multiple requests, the protocol allows multiple HTTP URL requests to be made in the same TCP packet. Any Web server which is HTTP 1.1 compliant should then process all the URLs requested in the single TCP packet and respond as usual.

The target Web server was found to support this functionality of the HTTP 1.1 protocol.

IMPACT:
Support for URL-Request Pipelining has interesting consequences. For example, as explained in this paper by Daniel Roelker, it can be used for evading detection by Intrusion Detection Systems. Also, it can be used in HTTP Response-Spliting style attacks.

SOLUTION:
N/A

RESULT:

Referrer-Policy HTTP Security Header Not Detected — port 80 / tcp

PCI COMPLIANCE STATUS

PASS

VULNERABILITY DETAILS

Severity:	1
QID:	48131
Category:	Information gathering
CVE ID:	-
Vendor Reference:	Referrer-Policy
Bugtraq ID:	-
Last Update:	2023-01-18 13:30:16.0

THREAT:
No Referrer Policy is specified for the link. It checks for one of the following Referrer Policy in the response headers:

1) no-referrer
2) no-referrer-when-downgrade
3) same-origin
4) origin
5) origin-when-cross-origin
6) strict-origin
7) strict-origin-when-cross-origin

QID Detection Logic(Unauthenticated):
If the Referrer Policy header is not found , checks in response body for meta tag containing tag name as "referrer" and one of the above Referrer Policy.

IMPACT:
The Referrer-Policy header controls how much referrer information is sent to a site when navigating to it. Absence of Referrer-Policy header can lead to leakage of sensitive information via the referrer header.

SOLUTION:
Referrer Policy header improves security by ensuring websites don't leak sensitive information via the referrer header. It's recommended to add secure Referrer Policies as a part of a defense-in-depth approach.

References:
- https://www.w3.org/TR/referrer-policy/

RESULT:
Referrer-Policy HTTP Header missing on 80 port.
GET / HTTP/1.1

Apache Default Foreign Language File Still on Server — port 4001 / tcp

PCI COMPLIANCE STATUS

PASS

VULNERABILITY DETAILS

Severity:	1
QID:	86743
Category:	Web server
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2006-07-11 16:04:25.0

THREAT:
Apache installs foreign language files along with index.html. The files are as follows:

index.html.ca
index.html.de
index.html.dk
index.html.ee

An attacker can get additional information about the Web server from these files.

IMPACT:
Sensitive system information may be disclosed, which can be utilized by an attacker to aid further attacks.

SOLUTION:
Apache recommends to remove these files from the Web server.

RESULT:
GET /index.html.ru.iso-ru HTTP/1.1
Host: 34-101-91-38.clients.gthost.com:4001

External (third party) CSS link detected — port 4001 / tcp

PCI COMPLIANCE STATUS

PASS

VULNERABILITY DETAILS

Severity:	**1**
QID:	150221
Category:	Web Application
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2024-10-15 22:36:08.0

THREAT:
Using resources from external locations is a security concern, including third-party stylesheet. Also detection of all external resources would be a requirement for certifications and audits.

IMPACT:
Using css from untrusted sources can result in external CSS injection and allow attacker to gain sensitive information.

SOLUTION:
Verify all the external CSS loaded on application are valid and from known sources.

RESULT:

Business logic abuse potential due to presence of external domains detected — port 443 / tcp

PCI COMPLIANCE STATUS

QID:	150845
Category:	Web Application
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2024-10-21 20:23:02.0

THREAT:
External domains detected in the application. Using external domains in an application introduces risk by potentially exposing the application to external threats and dependencies, which can be exploited for malicious purposes such as data exfiltration, phishing, or compromise of application integrity. These vulnerabilities arise from inadequate validation, reliance on unsecured external services, and the application's failure to enforce strict security controls over external interactions.

IMPACT:
N/A

SOLUTION:
Audit external domains accessed by your application. If possible launch scans against those.

RESULT:
External domains could be involved in potential business logic abuse.

Category:	Information gathering
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2022-09-15 18:02:52.0

THREAT:
The Host Scan Time is the period of time it takes the scanning engine to perform the vulnerability assessment of a single target host. The Host Scan Time for this host is reported in the Result section below.

The Host Scan Time does not have a direct correlation to the Duration time as displayed in the Report Summary section of a scan results report. The Duration is the period of time it takes the service to perform a scan task. The Duration includes the time it takes the service to scan all hosts, which may involve parallel scanning. It also includes the time it takes for a scanner appliance to pick up the scan task and transfer the results back to the service's Secure Operating Center. Further, when a scan task is distributed across multiple scanners, the Duration includes the time it takes to perform parallel host scanning on all scanners.

IMPACT:
N/A

SOLUTION:
N/A

RESULT:
Scan duration: 8494 seconds

Start time: Wed, Feb 12 2025, 16:32:25 GMT

Category:	TCP/IP
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2003-01-16 20:14:30.0

THREAT:
ICMP (Internet Control and Error Message Protocol) is a protocol encapsulated in IP packets. ICMP's principal purpose is to provide a protocol layer that informs gateways of the inter-connectivity and accessibility of other gateways or hosts.

We have sent the following types of packets to trigger the host to send us ICMP replies:

Echo Request (to trigger Echo Reply)
Timestamp Request (to trigger Timestamp Reply)
Address Mask Request (to trigger Address Mask Reply)
UDP Packet (to trigger Port Unreachable Reply)
IP Packet with Protocol >= 250 (to trigger Protocol Unreachable Reply)

Listed in the "Result" section are the ICMP replies that we have received.

IMPACT:

Category:	Information gathering
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2020-07-20 12:24:23.0

THREAT:
This QID prints the information, in the form of a text record, that a web server sends back to a client's browser in response to receiving a single HTTP GET request.

QID Detection Logic:
This QID returns the HTTP response method and header information returned by a web server.
IMPACT:
N/A
SOLUTION:
N/A
RESULT:
HTTP header and method information collected on port 80.

Referrer-Policy HTTP Security Header Not Detected — port 4001 / tcp

PCI COMPLIANCE STATUS

PASS

VULNERABILITY DETAILS

Severity:	1
QID:	48131
Category:	Information gathering
CVE ID:	-
Vendor Reference:	Referrer-Policy
Bugtraq ID:	-

Last Update:	2023-01-18 13:30:16.0

THREAT:

No Referrer Policy is specified for the link. It checks for one of the following Referrer Policy in the response headers:

1) no-referrer
2) no-referrer-when-downgrade
3) same-origin
4) origin
5) origin-when-cross-origin
6) strict-origin
7) strict-origin-when-cross-origin

QID Detection Logic(Unauthenticated):
If the Referrer Policy header is not found , checks in response body for meta tag containing tag name as "referrer" and one of the above Referrer Policy.

IMPACT:

The Referrer-Policy header controls how much referrer information is sent to a site when navigating to it. Absence of Referrer-Policy header can lead to leakage of sensitive information via the referrer header.

SOLUTION:

Referrer Policy header improves security by ensuring websites don't leak sensitive information via the referrer header. It's recommended to add secure Referrer Policies as a part of a defense-in-depth approach.

THREAT:
The information shown in the Result section was returned by the network infrastructure responsible for routing traffic from our cloud platform to the target network (where the scanner appliance is located).

This information was returned from: 1) the WHOIS service, or 2) the infrastructure provided by the closest gateway server to our cloud platform. If your ISP is routing traffic, your ISP's gateway server returned this information.

IMPACT:
This information can be used by malicious users to gather more information about the network infrastructure that may help in launching attacks against it.

Links Rejected By Crawl Scope or Exclusion List — port 4001 / tcp

Category:	Web Application
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2022-02-07 16:48:28.0

THREAT:
One or more links were not crawled because of an explicit rule to exclude them. This also occurs if a link is malformed.

Exclude list and Include list entries can cause links to be rejected. If a scan is limited to a specific starting directory, then links outside that directory will neither be crawled or tested.

Links that contain a host name or IP address different from the target application are considered external links and not crawled by default; those types of links are not listed here. This often happens when the scope of a scan is limited to the directory of the starting URL. The scope can be changed in the Web Application Record.

During the test phase, some path-based tests may be rejected if the scan is limited to the directory of the starting URL and the test would fall outside that directory. In these cases, the number of rejected links may be too high to list in the Results section.

IMPACT:
Links listed here were neither crawled or tested by the Web application scanning engine.

SOLUTION:
A link might have been intentionally matched by a exclude or include list entry. Verify that no links in this list were unintentionally rejected.

RESULT:
Links not permitted:

Apache2 Default Page
</span>
```

It works!

This is the default welcome page used to test the correct
operation of the Apache2 server after installation on Ubuntu systems.
It is based on the equivalent page on Debian, from which the Ubuntu Apache
packaging is derived.
If you can read this page, it means that the Apache HTTP server installed at
this site is working properly. You should replace this file (located at
<tt>/var/www/html/index.html</tt>) before continuing to operate your HTTP server.

If you are a normal user of this web site and don't know what this page is
about, this probably means that the site is currently unavailable due to
maintenance.
If the problem persists, please contact the site's administrator.

Configuration Overview

Ubuntu's Apache2 default configuration is different from the
upstream default configuration, and split into several files optimized for
interaction with Ubuntu tools. The configuration system is
fully documented in
/usr/share/doc/apache2/README.Debian.gz. Refer to this for the full
documentation. Documentation for the web server itself can be
found by accessing the manual if the <tt>apache2-doc</tt>
package was installed on this server.

The configuration layout for an Apache2 web server installation on Ubuntu systems is as follows:

<pre>
/etc/apache2/
|-- apache2.conf
| `-- ports.conf
|-- mods-enabled
| |-- *.load
| `-- *.conf
|-- conf-enabled
| `-- *.conf
|-- sites-enabled
| `-- *.conf

</pre>

<tt>apache2.conf</tt> is the main configuration
file. It puts the pieces together by including all remaining configuration
files when starting up the web server.

<tt>ports.conf</tt> is always included from the
main configuration file. It is used to determine the listening ports for
incoming connections, and this file can be customized anytime.

Configuration files in the <tt>mods-enabled/</tt>,
<tt>conf-enabled/</tt> and <tt>sites-enabled/</tt> directories contain
particular configuration snippets which manage modules, global configuration
fragments, or virtual host configurations, respectively.

They are activated by symlinking available
configuration files from their respective
*-available/ counterparts. These should be managed
by using our helpers
<tt>
a2enmod,
a2dismod,
</tt>
<tt>
a2ensite,
a2dissite,
</tt>
and
<tt>
a2enconf,
a2disconf
</tt>. See their respective man pages for detailed information.

The binary is called apache2 and is managed using systemd, so to
start/stop the service use <tt>systemctl start apache2</tt> and
<tt>systemctl stop apache2</tt>, and use <tt>systemctl status apache2</tt>
and <tt>journalctl -u apache2</tt> to check status. <tt>system</tt>
and <tt>apache2ctl</tt> can also be used for service management if
desired.
Calling <tt>/usr/bin/apache2</tt> directly will not work with the
default configuration.

Document Roots

By default, Ubuntu does not allow access through the web browser to
any file outside of those located in <tt>/var/www</tt>,
public_html
directories (when enabled) and <tt>/usr/share</tt> (for web
applications). If your site is using a web document root
located elsewhere (such as in <tt>/srv</tt>) you may need to whitelist your
document root directory in <tt>/etc/apache2/apache2.conf</tt>.

The default Ubuntu document root is <tt>/var/www/html</tt>. You
can make your own virtual hosts under /var/www.

Reporting Problems

Please use the <tt>ubuntu-bug</tt> tool to report bugs in the
Apache2 package with Ubuntu. However, check <a
href="https://bugs.launchpad.net/ubuntu/+source/apache2"
rel="nofollow">existing bug reports before reporting a new bug.

Please report bugs specific to modules (such as PHP and others)
to their respective packages, not to the web server itself.

CVE ID:	-

THREAT:
The values for the identification (ID) field in IP headers in IP packets from the host are analyzed to determine how random they are. The changes between subsequent ID values for either the network byte ordering or the host byte ordering, whichever is smaller, are displayed in the RESULT section along with the duration taken to send the probes. When incremental values are used, as is the case for TCP/IP implementation in many operating systems, these changes reflect the network load of the host at the time this test was conducted.

Please note that for reliability reasons only the network traffic from open TCP ports is analyzed.

CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2020-06-24 12:42:21.0

THREAT:

Scan activity per port is an estimate of the amount of internal process time the scanner engine spent scanning a particular TCP or UDP port. This information can be useful to determine the reason for long scan times. The individual time values represent internal process time, not elapsed time, and can be longer than the total scan time because of internal parallelism. High values are often caused by slowly responding services or services on which requests time out.

CVE ID:	-

THREAT:
The Apache HTTP Server Project is an effort to develop and maintain an open-source HTTP server for modern operating systems including UNIX and Windows. The goal of this project is to provide a secure, efficient and extensible server that provides HTTP services in sync with the current HTTP standards.

Apache HTTP Server was detected on the target.

QID Detection Logic (Authenticated):
Operating System: Linux

The detection looks for Apache HTTP Server installation path using ps command. The version is extracted from the Apache HTTP Server's binary.
Operating System: Windows
This QID checks Windows registry to see if Apache HTTP Server is installed. If found, it displays the installed version.

THREAT:
The Apache default installation or "Welcome" page is installed on this server. This usually indicates a newly installed server which has not yet been configured properly and which may not be known about.

Detection Logic(unauthenticated):
QID will check for the apache default Installation/Welcome Page on apache server.
IMPACT:
Apache is installed by default and the user may not be aware that the web server is running. These servers are rarely patched and rarely monitored, providing hackers with a convenient target that is not likely to trip any alarms.
SOLUTION:
Customers are recommended to disable default Apache welcome configuration.

Configuration Overview
</div>
<div class="content_section_text">
<p>
Ubuntu&apos;s Apache2 default configuration is different from the
upstream default configuration, and split into several files optimized for
interaction with Ubuntu tools. The configuration system is
<b>fully documented in
/usr/share/doc/apache2/README.Debian.gz</b>. Refer to this for the full
documentation. Documentation for the web server itself can be
found by accessing the <a href="/manual">manual</a> if the <tt>apache2-doc</tt>
package was installed on this server.
```

The configuration layout for an Apache2 web server installation on Ubuntu systems is as follows:

<pre>
/etc/apache2/
|-- apache2.conf
| `-- ports.conf
|-- mods-enabled
| |-- *.load
| `-- *.conf
|-- conf-enabled
| `-- *.conf
|-- sites-enabled
| `-- *.conf
</pre>

<tt>apache2.conf</tt> is the main configuration
file. It puts the pieces together by including all remaining configuration
files when starting up the web server.

<tt>ports.conf</tt> is always included from the
main configuration file. It is used to determine the listening ports for
incoming connections, and this file can be customized anytime.

Configuration files in the <tt>mods-enabled/</tt>,
<tt>conf-enabled/</tt> and <tt>sites-enabled/</tt> directories contain
particular configuration snippets which manage modules, global configuration
fragments, or virtual host configurations, respectively.

They are activated by symlinking available
configuration files from their respective
*-available/ counterparts. These should be managed
by using our helpers
<tt>
a2enmod,
a2dismod,
</tt>
<tt>
a2ensite,
a2dissite,
</tt>
and
<tt>
a2enconf,
a2disconf
</tt>. See their respective man pages for detailed information.

The binary is called apache2 and is managed using systemd, so to
start/stop the service use <tt>systemctl start apache2</tt> and
<tt>systemctl stop apache2</tt>, and use <tt>systemctl status apache2</tt>
and <tt>journalctl -u apache2</tt> to check status. <tt>system</tt>
and <tt>apache2ctl</tt> can also be used for service management if
desired.
Calling <tt>/usr/bin/apache2</tt> directly will not work with the
default configuration.

Document Roots

By default, Ubuntu does not allow access through the web browser to
any file outside of those located in <tt>/var/www</tt>,
public_html
directories (when enabled) and <tt>/usr/share</tt> (for web
applications). If your site is using a web document root
located elsewhere (such as in <tt>/srv</tt>) you may need to whitelist your
document root directory in <tt>/etc/apache2/apache2.conf</tt>.

The default Ubuntu document root is <tt>/var/www/html</tt>. You
can make your own virtual hosts under /var/www.

Reporting Problems

Please use the <tt>ubuntu-bug</tt> tool to report bugs in the
Apache2 package with Ubuntu. However, check <a
href="https://bugs.launchpad.net/ubuntu/+source/apache2"
rel="nofollow">existing bug reports before reporting a new bug.

Please report bugs specific to modules (such as PHP and others)
to their respective packages, not to the web server itself.

QID:	82023
Category:	TCP/IP
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2024-12-19 13:22:09.0

THREAT:
The port scanner enables unauthorized users with the appropriate tools to draw a map of all services on this host that can be accessed from the Internet. The test was carried out with a "stealth" port scanner so that the server does not log real connections.

The Results section displays the port number (Port), the default service listening on the port (IANA Assigned Ports/Services), the description of the service (Description) and the service that the scanner detected using service discovery (Service Detected).

IMPACT:
Unauthorized users can exploit this information to test vulnerabilities in each of the open services.

SOLUTION:
Shut down any unknown or unused service on the list. If you have difficulty figuring out which service is provided by which process or program, contact your provider's support team. For more information about commercial and open-source Intrusion Detection Systems available for detecting port scanners of this kind, visit the CERT Web site.

Category:	Information gathering
CVE ID:	-
Vendor Reference:	Referrer-Policy
Bugtraq ID:	-
Last Update:	2023-01-18 13:30:16.0

THREAT:

No Referrer Policy is specified for the link. It checks for one of the following Referrer Policy in the response headers:

1) no-referrer
2) no-referrer-when-downgrade
3) same-origin

4) origin
5) origin-when-cross-origin
6) strict-origin
7) strict-origin-when-cross-origin

QID Detection Logic(Unauthenticated):
If the Referrer Policy header is not found , checks in response body for meta tag containing tag name as "referrer" and one of the above Referrer Policy.

IMPACT:
The Referrer-Policy header controls how much referrer information is sent to a site when navigating to it. Absence of Referrer-Policy header can lead to leakage of sensitive information via the referrer header.

SOLUTION:
Referrer Policy header improves security by ensuring websites don't leak sensitive information via the referrer header. It's recommended to add secure Referrer Policies as a part of a defense-in-depth approach.

Links Rejected By Crawl Scope or Exclusion List — port 80 / tcp

PCI COMPLIANCE STATUS

VULNERABILITY DETAILS

Severity:	1
QID:	150020
Category:	Web Application
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2022-02-07 16:48:28.0

THREAT:
One or more links were not crawled because of an explicit rule to exclude them. This also occurs if a link is malformed.

Exclude list and Include list entries can cause links to be rejected. If a scan is limited to a specific starting directory, then links outside that directory will neither be crawled or tested.

Links that contain a host name or IP address different from the target application are considered external links and not crawled by default; those types of links are not listed here. This often happens when the scope of a scan is limited to the directory of the starting URL. The scope can be changed in the Web Application Record.

During the test phase, some path-based tests may be rejected if the scan is limited to the directory of the starting URL and the test would fall outside that directory. In these cases, the number of rejected links may be too high to list in the Results section.

IMPACT:
Links listed here were neither crawled or tested by the Web application scanning engine.

SOLUTION:
A link might have been intentionally matched by a exclude or include list entry. Verify that no links in this list were unintentionally rejected.

RESULT:
Links not permitted:

Web Server Supports HTTP Request Pipelining — port 443 / tcp

PCI COMPLIANCE STATUS

Severity:	1
QID:	86565
Category:	Web server
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2005-02-23 00:25:38.0

THREAT:
Version 1.1 of the HTTP protocol supports URL-Request Pipelining. This means that instead of using the "Keep-Alive" method to keep the TCP connection alive over multiple requests, the protocol allows multiple HTTP URL requests to be made in the same TCP packet. Any Web server which is HTTP 1.1 compliant should then process all the URLs requested in the single TCP packet and respond as usual.

The target Web server was found to support this functionality of the HTTP 1.1 protocol.

IMPACT:
Support for URL-Request Pipelining has interesting consequences. For example, as explained in this paper by Daniel Roelker, it can be used for evading detection by Intrusion Detection Systems. Also, it can be used in HTTP Response-Spliting style attacks.

Degree of Randomness of TCP Initial Sequence Numbers

PCI COMPLIANCE STATUS

VULNERABILITY DETAILS

Severity:	1
QID:	82045
Category:	TCP/IP
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2004-11-19 21:53:59.0

THREAT:
TCP Initial Sequence Numbers (ISNs) obtained in the SYNACK replies from the host are analyzed to determine how random they are. The average change between subsequent ISNs and the standard deviation from the average are displayed in the RESULT section. Also included is the degree of difficulty for exploitation of the TCP ISN generation scheme used by the host.

IMPACT:
N/A

SOLUTION:
N/A

RESULT:
Average change between subsequent TCP initial sequence numbers is 810420776 with a standard deviation of 654602902. These TCP initial sequence numbers were triggered by TCP SYN probes sent to the host at an average rate of 1/(5103 microseconds). The degree of difficulty to exploit the TCP initial sequence number generation scheme is: hard.

Business logic abuse potential due to presence of external domains detected — port 4001 / tcp

VULNERABILITY DETAILS

Severity:	1
QID:	150845
Category:	Web Application
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2024-10-21 20:23:02.0

THREAT:
External domains detected in the application. Using external domains in an application introduces risk by potentially exposing the application to external threats and dependencies, which can be exploited for malicious purposes such as data exfiltration, phishing, or compromise of application integrity. These vulnerabilities arise from inadequate validation, reliance on unsecured external services, and the application's failure to enforce strict security controls over external interactions.

IMPACT:
N/A

SOLUTION:
Audit external domains accessed by your application. If possible launch scans against those.

RESULT:
External domains could be involved in potential business logic abuse.

Links Rejected By Crawl Scope or Exclusion List — port 4000 / tcp

PCI COMPLIANCE STATUS

PASS

VULNERABILITY DETAILS

Severity:	1
QID:	150020
Category:	Web Application
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2022-02-07 16:48:28.0

THREAT:
One or more links were not crawled because of an explicit rule to exclude them. This also occurs if a link is malformed.

Exclude list and Include list entries can cause links to be rejected. If a scan is limited to a specific starting directory, then links outside that directory will neither be crawled or tested.

Links that contain a host name or IP address different from the target application are considered external links and not crawled by default; those types of links are not listed here. This often happens when the scope of a scan is limited to the directory of the starting URL. The scope can be changed in the Web Application Record.

During the test phase, some path-based tests may be rejected if the scan is limited to the directory of the starting URL and the test would fall outside that directory. In these cases, the number of rejected links may be too high to list in the Results section.

IMPACT:
Links listed here were neither crawled or tested by the Web application scanning engine.

SOLUTION:
A link might have been intentionally matched by a exclude or include list entry. Verify that no links in this list were unintentionally rejected.

RESULT:
Links not permitted:
(This list includes links from QIDs: 150010,150041,150143,150170)

It is based on the equivalent page on Debian, from which the Ubuntu Apache
packaging is derived.
If you can read this page, it means that the Apache HTTP server installed at
this site is working properly. You should <b>replace this file</b> (located at

If you are a normal user of this web site and don&apos;t know what this page is

If the problem persists, please contact the site's administrator.

Configuration Overview

Ubuntu's Apache2 default configuration is different from the
upstream default configuration, and split into several files optimized for
interaction with Ubuntu tools. The configuration system is
fully documented in
/usr/share/doc/apache2/README.Debian.gz. Refer to this for the full
documentation. Documentation for the web server itself can be
found by accessing the manual if the <tt>apache2-doc</tt>
package was installed on this server.

The configuration layout for an Apache2 web server installation on Ubuntu systems is as follows:

<pre>
/etc/apache2/
|-- apache2.conf
| `-- ports.conf
|-- mods-enabled
| |-- *.load
| `-- *.conf
|-- conf-enabled
| `-- *.conf
|-- sites-enabled
| `-- *.conf
</pre>

<tt>apache2.conf</tt> is the main configuration
file. It puts the pieces together by including all remaining configuration
files when starting up the web server.

<tt>ports.conf</tt> is always included from the
main configuration file. It is used to determine the listening ports for
incoming connections, and this file can be customized anytime.

Configuration files in the <tt>mods-enabled/</tt>,
<tt>conf-enabled/</tt> and <tt>sites-enabled/</tt> directories contain
particular configuration snippets which manage modules, global configuration
fragments, or virtual host configurations, respectively.

They are activated by symlinking available

configuration files from their respective
*-available/ counterparts. These should be managed
by using our helpers
<tt>
a2enmod,
a2dismod,
</tt>
<tt>
a2ensite,
a2dissite,
</tt>
and
<tt>
a2enconf,
a2disconf
</tt>. See their respective man pages for detailed information.

The binary is called apache2 and is managed using systemd, so to
start/stop the service use <tt>systemctl start apache2</tt> and
<tt>systemctl stop apache2</tt>, and use <tt>systemctl status apache2</tt>
and <tt>journalctl -u apache2</tt> to check status. <tt>system</tt>
and <tt>apache2ctl</tt> can also be used for service management if
desired.
Calling <tt>/usr/bin/apache2</tt> directly will not work with the
default configuration.

Document Roots

By default, Ubuntu does not allow access through the web browser to
any file outside of those located in <tt>/var/www</tt>,
public_html
directories (when enabled) and <tt>/usr/share</tt> (for web
applications). If your site is using a web document root
located elsewhere (such as in <tt>/srv</tt>) you may need to whitelist your
document root directory in <tt>/etc/apache2/apache2.conf</tt>.

The default Ubuntu document root is <tt>/var/www/html</tt>. You
can make your own virtual hosts under /var/www.

Reporting Problems

Please use the <tt>ubuntu-bug</tt> tool to report bugs in the
Apache2 package with Ubuntu. However, check <a
href="https://bugs.launchpad.net/ubuntu/+source/apache2"
rel="nofollow">existing bug reports before reporting a new bug.

Please report bugs specific to modules (such as PHP and others)
to their respective packages, not to the web server itself.

THREAT:
A file, directory, or directory listing was discovered on the Web server. These resources are confirmed to be present based on our logic. Some of the content on these files might have sensitive information.

NOTE: Links found in 150004 are found by forced crawling so will not automatically be added to 150009 Links Crawled or the application site map. If links found in 150004 need to be tested they must be added as Explicit URI so they are included in scope and then will be reported in 150009. Once the link is added to be in scope (i. e. Explicit URI) this same link will no longer be reported for 150004.

IMPACT:
The contents of this file or directory may disclose sensitive information.

SOLUTION:
It is advised to review the contents of the disclosed files. If the contents contain sensitive information, please verify that access to this file or directory is permitted. If necessary, remove it or apply access controls to it.

CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2022-02-28 13:28:19.0

THREAT:
An SSL Certificate associates an entity (person, organization, host, etc.) with a Public Key. In an SSL connection, the client authenticates the remote server using the server's Certificate and extracts the Public Key in the Certificate to establish the secure connection. The authentication is done by verifying that the public key in the certificate is signed by a trusted third-party Certificate Authority.

If a client is unable to verify the certificate, it can abort communication or prompt the user to continue the communication without authentication.

IMPACT:
By exploiting this vulnerability, man-in-the-middle attacks in tandem with DNS cache poisoning can occur.

Exception:
If the server communicates only with a restricted set of clients who have the server certificate or the trusted CA certificate, then the server or CA certificate may not be available publicly, and the scan will be unable to verify the signature.

SOLUTION:
Please install a server certificate signed by a trusted third-party Certificate Authority.

RESULT:
Certificate #0 CN=www.foxbridge.ca ISSUER:_CN=Go_Daddy_Secure_Certificate_Authority_-_G2,OU=http://certs.godaddy.com/repository/,O=GoDaddy.com\,_Inc.,L=Scottsdale,ST=Arizona,C=US certificate has expired

Last Update:	2019-10-11 16:30:02.0

THREAT:
An SSL Certificate associates an entity (person, organization, host, etc.) with a Public Key. In an SSL connection, the client authenticates the remote server using the server's Certificate and extracts the Public Key in the Certificate to establish the secure connection.

A certificate whose Subject commonName or subjectAltName does not match the server FQDN offers only encryption without authentication.

Please note that a false positive reporting of this vulnerability is possible in the following case:

If the common name of the certificate uses a wildcard such as *.somedomainname.com and the reverse DNS resolution of the target IP is not configured. In this case there is no way for Qualys to associate the wildcard common name to the IP. Adding a reverse DNS lookup entry to the target IP will solve this problem.

IMPACT:
A man-in-the-middle attacker can exploit this vulnerability in tandem with a DNS cache poisoning attack to lure the client to another server, and then steal all the encryption communication.

SOLUTION:
Please install a server certificate whose Subject commonName or subjectAltName matches the server FQDN.

RESULT:
Certificate #0 CN=www.foxbridge.ca (www.foxbridge.ca) and IP (67.220.85.26) don't match

THREAT:
The SSH protocol (Secure Shell) is a method for secure remote login from one computer to another. The target is using deprecated SHA1 cryptographic settings to communicate.

IMPACT:
vulnerable to collision attacks, which are designed to fabricate the same hash value for different input data.each hash is supposedly unique.

SOLUTION:
Avoid using deprecated cryptographic settings.

Use best practices when configuring SSH.

Refer to NIST Retires SHA-1 Cryptographic Algorithm (SSH) .

CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2024-08-03 05:00:01.0

THREAT:
Reverse Tabnabbing is an attack where the target page is replaced by phishing site. This is possible when target="_blank" is in use with rel="noopener" or rel="noreferrer", attacker can use JavaScript window.opener and inject malicious domain in it. When user clicks on html link, they will get redirected to phishing or unintentional website.
WAS detects this vulnerability during crawling and evaluates HTML links embedded in anchor tags.

IMPACT:
The user may be redirected to an untrusted page that contains undesired content or malicious script code.

SOLUTION:
Use either of these attributes rel="noreferrer" or rel="noopener".
Implement Cross Origin Opener Policy header.

Reverse Tabnabbing — port 80 / tcp

PCI COMPLIANCE STATUS

PCI Severity Level: LOW

PASS — The vulnerability is not included in the NVD.

VULNERABILITY DETAILS

CVSS Base Score:	**2.6** AV:N/AC:H/Au:N/C:P/I:N/A:N
CVSS Temporal Score:	**2.0** E:U/RL:W/RC:UR

Severity:	**1**
QID:	150222
Category:	Web Application
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2024-08-03 05:00:01.0

THREAT:

Reverse Tabnabbing is an attack where the target page is replaced by phishing site. This is possible when target="_blank" is in use with rel="noopener" or rel="noreferrer", attacker can use JavaScript window.opener and inject malicious domain in it. When user clicks on html link, they will get redirected to phishing or unintentional website.

WAS detects this vulnerability during crawling and evaluates HTML links embedded in anchor tags.

IMPACT:

The user may be redirected to an untrusted page that contains undesired content or malicious script code.

SOLUTION:

Use either of these attributes rel="noreferrer" or rel="noopener".

Implement Cross Origin Opener Policy header.

CVE ID:	CVE-1999-0524
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2024-11-26 18:01:42.0

THREAT:
ICMP (Internet Control and Error Message Protocol) is a protocol encapsulated in IP packets. It's principal purpose is to provide a protocol layer able to inform gateways of the inter-connectivity and accessibility of other gateways or hosts. "ping" is a well-known program for determining if a host is up or down. It uses ICMP echo packets.

ICMP timestamp packets are used to synchronize clocks between hosts. Revealing the current time on the system may facilitate attackers to mount further attacks. Since the risk is especially high on internet facing targets, this vulnerability will be flagged only be Internet scanners hosted by Qualys. Internal targets will not be flagged with this vulnerability.

Please see QID:82040 for a list of supported ICMP packet types.

IMPACT:
Unauthorized users can obtain information about your network by sending ICMP timestamp packets. For example, the internal systems clock should not be disclosed since some internal daemons use this value to calculate ID or sequence numbers (i.e., on SunOS servers).

SOLUTION:
You can filter ICMP messages of type "Timestamp" and "Timestamp Reply" at the firewall level. Some system administrators choose to filter most types of ICMP messages for various reasons. For example, they may want to protect their internal hosts from ICMP-based Denial Of Service attacks, such as the *Ping of Death* or *Smurf* attacks.

However, you should never filter **ALL** ICMP messages, as some of them ("Don't Fragment", "Destination Unreachable", "Source Quench", etc) are necessary for proper behavior of Operating System TCP/IP stacks.

It may be wiser to contact your network consultants for advice, since this issue impacts your overall network reliability and security.

RESULT:

CVE ID:	CVE-2023-28531
Vendor Reference:	OpenSSH Advisory
Bugtraq ID:	-
Last Update:	2024-12-11 13:21:59.0

THREAT:

OpenSSH (OpenBSD Secure Shell) is a set of computer programs providing encrypted communication sessions over a computer network using the SSH protocol.

Affected Versions:

OpenSSH version 8.9 and above prior to 9.3

QID Detection Logic:

This unauthenticated detection works by reviewing the version of the OpenSSH service.

IMPACT:

Successfully exploitation of this vulnerability could lead to disclosure of sensitive information, addition or modification of data, or Denial of Service (DoS).

SOLUTION:

Customers are advised to upgrade to OpenSSH 9.3 or later to remediate these vulnerabilities.

Patch:

Following are links for downloading patches to fix the vulnerabilities:

CVE ID:	-
Vendor Reference:	NGINX Security Advisory
Bugtraq ID:	-
Last Update:	2022-09-27 06:09:28.0

THREAT:

nginx [engine x] is an HTTP and reverse proxy server, a mail proxy server, and a generic TCP/UDP proxy server.

An nginx Zero-Day RCE issue was identified in the nginx LDAP-auth daemon implementation.

Affected Versions:
Nginx version 1.18

QID Detection Logic (Unauthenticated):
This QID performs an unauthenticated check for vulnerable versions of Nginx by grabbing the version number from the server banner of the HTTP response after sending HTTP GET method for status code 2xx-5xx.

Note: This QID does not check for LDAP implementation of NGINX and is therefore kept potential

IMPACT:

Successful exploitation of the vulnerability may allow arbitrary remote code execution.

SOLUTION:

Patch is not available, for more information about this vulnerability please refer to Nginx RCE Vulnerability

Vendor Reference:	OpenSSH 9.6
Bugtraq ID:	-
Last Update:	2024-12-11 13:21:59.0

THREAT:

OpenSSH is a set of computer programs providing encrypted communication sessions over a computer network using the SSH protocol.

In OpenSSH, when common types of DRAM are used, might allow row hammer attacks (for authentication bypass) because the integer value of authenticated in mm_answer_authpassword does not resist flips of a single bit.

Affected Versions:
OpenSSH up to version 9.6

QID Detection Logic:
This unauthenticated detection works by reviewing the version of the OpenSSH service.

IMPACT:
Successful exploitation allows OS command injection and row hammer attacks for authentication bypass.
SOLUTION:
There are no vendor supplied patches available at this time.

RESULT:

Affected Versions:
NGINX version from 0.6.18 to 1.20.0

QID Detection Logic (Unauthenticated):
The unauthenticated check tries to fetch the version from the version exposed in the Server: tag of a HTTP response.

IMPACT:
Successful exploitation may lead to arbitrary code execution.
SOLUTION:
Customers are advised to install nginx 1.21.0, 1.20.1 to remediate this vulnerability.

Vendor Reference:	Nginx
Bugtraq ID:	-
Last Update:	2025-01-31 12:00:02.0

THREAT:
nginx [engine x] is an HTTP and reverse proxy server, a mail proxy server, and a generic TCP/UDP proxy server.

A security issue in nginx resolver was identified, which might allow an attacker to cause 1-byte memory overwrite by using a specially crafted DNS response

Affected Versions:
NGINX version from 0.6.18 to 1.20.0

QID Detection Logic (Unauthenticated):
The unauthenticated check tries to fetch the version from the version exposed in the Server: tag of a HTTP response.

Nginx Multiple HTTP/3 QUIC vulnerabilities (CVE-2024-24989, CVE-2024-24990) — port 80 / tcp

PCI COMPLIANCE STATUS

PCI Severity Level: HIGH

PASS

The vulnerability is purely a denial-of-service (DoS) vulnerability.

VULNERABILITY DETAILS

CVSS Base Score:	**7.8** AV:N/AC:L/Au:N/C:N/I:N/A:C
CVSS Temporal Score:	**5.8** E:U/RL:OF/RC:C

Vendor Reference:	Nginx
Bugtraq ID:	-
Last Update:	2025-01-25 04:00:01.0

THREAT:

Nginx is a web server that can also be used as a reverse proxy, load balancer, mail proxy and HTTP cache.

When NGINX Plus or NGINX OSS are configured to use the HTTP/3 QUIC module (ngx_http_v3_module), undisclosed requests can cause NGINX worker processes to terminate.

Affected Versions:
NGINX Open source mainline version 1.25.3 or earlier
NGINX Open source subscription packages R5 or R6
NGINX Plus R30 or R31

QID Detection Logic:
This QID checks for the nginx web server by sending a GET request and checking the response header.

IMPACT:

This vulnerability allows a remote unauthenticated attacker to cause a denial-of-service (DoS) on the NGINX system.

SOLUTION:

Customers are advised toupgrade your NGINX software to the latest version to remediate this vulnerability. For more information related to this vulnerability please refer to Nginx Advisory.

Category:	Information gathering
CVE ID:	-
Vendor Reference:	Content-Security-Policy
Bugtraq ID:	-
Last Update:	2019-03-11 17:50:46.0

THREAT:
The HTTP Content-Security-Policy response header allows web site administrators to control resources the user agent is allowed to load for a given page. This helps guard against cross-site scripting attacks (XSS).

QID Detection Logic:
This QID detects the absence of the Content-Security-Policy HTTP header by transmitting a GET request.

IMPACT:

Category:	General remote services
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2024-05-20 12:30:20.0

THREAT:
A remote access or remote management service was detected. If such a service is accessible to malicious users it can be used to carry different type of attacks. Malicious users could try to brute force credentials or collect additional information on the service which could enable them in crafting further attacks.

The Results section includes information on the remote access service that was found on the target.

Services like Telnet, Rlogin, SSH, windows remote desktop, pcAnywhere, Citrix Management Console, Remote Admin (RAdmin), VNC, OPENVPN and ISAKMP are checked.

IMPACT:
Consequences vary by the type of attack.

SOLUTION:
Expose the remote access or remote management services only to the system administrators or intended users of the system.

RESULT:
Service name: SSH on TCP port 22.

Category:	Web Application
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2024-06-20 06:49:17.0

THREAT:

During the WAS scan, links or end points with HTTP 5xx response code were observed and these are listed in the Results section. The HTTP 5xx message indicates a server error. The list of supported 5xx response code are as below:

500 - Internal Server Error
501 - Not Implemented
502 - Bad Gateway
503 - Service Unavailable
504 - Gateway Timeout
505 - HTTP Version Not Supported

IMPACT:

The presence of a HTTP 5xx error during the crawl phase indicates that some problem exists on the website that will be encountered during normal usage of the Web application. Note WAS depends on responses to detect many vulnerabilities. If expected response is not received then vulnerabilities present on such links or end points may not be detected.

SOLUTION:

Review each link to determine why the server encountered an error when responding to the link. Review and investigate the results of QID 150528 which lists 4xx errors and QID 150019 which lists unexpected response codes.

Host Uptime Based on TCP TimeStamp Option

PCI COMPLIANCE STATUS

PASS

VULNERABILITY DETAILS

Severity:	**2**
QID:	82063
Category:	TCP/IP
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2007-05-29 18:56:36.0

THREAT:
The TCP/IP stack on the host supports the TCP TimeStamp (kind 8) option. Typically the timestamp used is the host's uptime (since last reboot) in various units (e.g., one hundredth of second, one tenth of a second, etc.). Based on this, we can obtain the host's uptime. The result is given in the Result section below.

Some operating systems (e.g., MacOS, OpenBSD) use a non-zero, probably random, initial value for the timestamp. For these operating systems, the uptime obtained does not reflect the actual uptime of the host; the former is always larger than the latter.

IMPACT:
N/A

SOLUTION:
N/A

RESULT:
Based on TCP timestamps obtained via port 22, the host's uptime is 25 days, 18 hours, and 21 minutes.
The TCP timestamps from the host are in units of 1 milliseconds.

Last Update:	2025-02-11 13:32:02.0

THREAT:
Several different techniques can be used to identify the operating system (OS) running on a host. A short description of these techniques is provided below. The specific technique used to identify the OS on this host is included in the RESULTS section of your report.

1) **TCP/IP Fingerprint**: The operating system of a host can be identified from a remote system using TCP/IP fingerprinting. All underlying operating system TCP/IP stacks have subtle differences that can be seen in their responses to specially-crafted TCP packets. According to the results of this "fingerprinting" technique, the OS version is among those listed below.

Note that if one or more of these subtle differences are modified by a firewall or a packet filtering device between the scanner and the host, the fingerprinting technique may fail. Consequently, the version of the OS may not be detected correctly. If the host is behind a proxy-type firewall, the version of the operating system detected may be that of the firewall instead of the host being scanned.

2) **NetBIOS**: Short for Network Basic Input Output System, an application programming interface (API) that augments the DOS BIOS by adding special functions for local-area networks (LANs). Almost all LANs for PCs are based on the NetBIOS. Some LAN manufacturers have even extended it, adding additional network capabilities. NetBIOS relies on a message format called Server Message Block (SMB).

3) **PHP Info**: PHP is a hypertext pre-processor, an open-source, server-side, HTML-embedded scripting language used to create dynamic Web pages. Under some configurations it is possible to call PHP functions like phpinfo() and obtain operating system information.

4) **SNMP**: The Simple Network Monitoring Protocol is used to monitor hosts, routers, and the networks to which they attach. The SNMP service maintains Management Information Base (MIB), a set of variables (database) that can be fetched by Managers. These include "MIB_II.system.sysDescr" for the operating system.

Category:	General remote services
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2016-05-24 21:02:48.0

THREAT:

The following is a list of supported SSL ciphers.

Note: If a cipher is included in this list it means that it was possible to establish a SSL connection using that cipher. There are some web servers setups that allow connections to be established using a LOW grade cipher, only to provide a web page stating that the URL is accessible only through a non-LOW grade cipher. In this case even though LOW grade cipher will be listed here QID 38140 will not be reported.

Links Rejected By Crawl Scope or Exclusion List — port 80 / tcp

PCI COMPLIANCE STATUS

PASS

VULNERABILITY DETAILS

Severity:	1
QID:	150020
Category:	Web Application
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2022-02-07 16:48:28.0

THREAT:

One or more links were not crawled because of an explicit rule to exclude them. This also occurs if a link is malformed.

Exclude list and Include list entries can cause links to be rejected. If a scan is limited to a specific starting directory, then links outside that directory will neither be crawled or tested.

Links that contain a host name or IP address different from the target application are considered external links and not crawled by default; those types of links are not listed here. This often happens when the scope of a scan is limited to the directory of the starting URL. The scope can be changed in the Web Application Record.

During the test phase, some path-based tests may be rejected if the scan is limited to the directory of the starting URL and the test would fall outside that directory. In these cases, the number of rejected links may be too high to list in the Results section.

IMPACT:
Links listed here were neither crawled or tested by the Web application scanning engine.

SOLUTION:
A link might have been intentionally matched by a exclude or include list entry. Verify that no links in this list were unintentionally rejected.

RESULT:
Links not permitted:
(This list includes links from QIDs: 150010,150041,150143,150170)

External links discovered:
https://www.foxbridge.ca/
https://www.foxbridge.ca/.

IP based excluded links:
Links rejected during the test phase not reported due to volume of links.

THREAT:
ICMP (Internet Control and Error Message Protocol) is a protocol encapsulated in IP packets. ICMP's principal purpose is to provide a protocol layer that informs gateways of the inter-connectivity and accessibility of other gateways or hosts.

We have sent the following types of packets to trigger the host to send us ICMP replies:

Echo Request (to trigger Echo Reply)
Timestamp Request (to trigger Timestamp Reply)
Address Mask Request (to trigger Address Mask Reply)
UDP Packet (to trigger Port Unreachable Reply)
IP Packet with Protocol >= 250 (to trigger Protocol Unreachable Reply)

Listed in the "Result" section are the ICMP replies that we have received.

Category:	TCP/IP
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2006-07-27 21:45:19.0

THREAT:
The values for the identification (ID) field in IP headers in IP packets from the host are analyzed to determine how random they are. The changes between subsequent ID values for either the network byte ordering or the host byte ordering, whichever is smaller, are displayed in the RESULT section along with the duration taken to send the probes. When incremental values are used, as is the case for TCP/IP implementation in many operating systems, these changes reflect the network load of the host at the time this test was conducted.

Please note that for reliability reasons only the network traffic from open TCP ports is analyzed.

THREAT:
External domains detected in the application. Using external domains in an application introduces risk by potentially exposing the application to external threats and dependencies, which can be exploited for malicious purposes such as data exfiltration, phishing, or compromise of application integrity. These vulnerabilities arise from inadequate validation, reliance on unsecured external services, and the application's failure to enforce strict security controls over external interactions.

IMPACT:
N/A

SOLUTION:
Audit external domains accessed by your application. If possible launch scans against those.

RESULT:
External domains could be involved in potential business logic abuse.

Join us on our 1 hour canal tour on our 100% electric, luxury boats.

Enjoy all the beauty that Amsterdam has to offer while enjoying a drink. All our boats have a bar on board where drinks can be bought. During the tour our crew will tell you about the history of Amsterdam and the sights you pass.

During summer, when the weather is mainly sunny and dry, the tour will take place on one of our luxurious open boats. On the other hand, if it happens to be rainy or cold on the canals, we will be very happy to host the tour on one of our beautiful and warm saloon boats.

In order to ensure you a spot on the boat, we advise you to book your ticket online in advanced."><meta _ngcontent-sc104="" itemprop="mpn" content="75227P1"><div _ngcontent-sc104="" itemprop="brand" itemtype="http://schema.org/Brand" itemscope=""><meta _ngcontent-sc104="" itemprop="name" content="Destina holidays"> <div _ngcontent-sc104="" class="col-md-12 no-border"><div _ngcontent-sc104="" class="c_card"><div _ngcontent-sc104="" class="card-img"><img _ngcontent-sc104="" class="img-fluid"> <div _ngcontent-sc104="" class="card-body"><div _ngcontent-sc104="" class="card-title">Flagship Amsterdam Open Boat Canal Cruise - Local live guide with bar on board <div _ngcontent-sc104="" itemprop="aggregateRating" itemtype="http://schema.org/AggregateRating" itemscope="" class="card-subtitle"><span _ngcontent-sc104="" class="pe-1"><i _ngcontent-sc104="" class="fas fa-star checked"></i><span _ngcontent-sc104="" class="pe-1"><i _ngcontent-sc104="" class="fas fa-star checked"></i><span _ngcontent-sc104="" class="pe-1"><i _ngcontent-sc104="" class="fas fa-star checked"></i><span _ngcontent-sc104="" class="pe-1"><i _ngcontent-sc104="" class="fas fa-star checked"></i><span _ngcontent-sc104="" class="pe-1"><i _ngcontent-sc104="" class="fas fa-star checked"></i><!----><!----><span _ngcontent-sc104="" class="gray"> 15407 <meta _ngcontent-sc104="" itemprop="reviewCount" content="15407"><meta _ngcontent-sc104="" itemprop="ratingValue" content="5"> <div _ngcontent-sc104="" class="card-text"><div _ngcontent-sc104="" class="row"><div _ngcontent-sc104="" class="col-md-7"><span _ngcontent-sc104="" class="pe-1"><i _ngcontent-sc104="" class="fal fa-clock"></i> 1 hour <br _ngcontent-sc104=""><i _ngcontent-sc104="" class="far fa-map"></i> Amsterdam <div _ngcontent-sc104="" itemprop="offers" itemtype="http://schema.org/Offer" itemscope="" class="col-md-5 text-end card-price"><link _ngcontent-sc104="" itemprop="url" href="/tours/Netherlands/Amsterdam/75227P1"><meta _ngcontent-sc104="" itemprop="availability" content="https://schema.org/InStock"><meta _ngcontent-sc104="" itemprop="price" content="22"><meta _ngcontent-sc104="" itemprop="offerCount" content="1"><meta _ngcontent-sc104="" itemprop="priceCurrency" content="USD"><meta _ngcontent-sc104="" itemprop="priceValidUntil" content="2026-2-12"><span _ngcontent-sc104="" class="price"> $22 ^{USD} <div _ngcontent-sc104="" class="item"><div _ngcontent-sc104="" itemtype="http://schema.org/Product" itemscope="" class="row no-gutters recommended-card"><meta _ngcontent-sc104="" itemprop="name" content="Flagship Canal Cruise in Classic Boat - Live guide with drinks & Dutch cheese"><link _ngcontent-sc104="" itemprop="image" href="https://media.tacdn.com/media/attractions-splice-spp-674x446/09/3a/8a/80.jpg"><meta _ngcontent-sc104="" itemprop="description" content="On this 1 hour Luxury Classic River Boat Cruise, you will explore the city, its famous landmarks, culture, and rich trading history whilst relaxing with a drink in your hand. A 4WD in the sandy dunes of the deserts witnessing the sun going down into the depths of the golden sands will give any adventure lover the thrills of a lifetime. As the sun sets, the Al-Khayma Camp awaits you with a delicious BBQ and other fun-filled activities and when the stars light up the sky, be ready for an amazing star gazing session.

Highlights
Enjoy an evening at the exclusive Al Khayma Desert Camp
Bash dunes for 30-40-minutes in the Lahbab desert
Enjoy the BBQ with local cuisines (veg and non-veg)
Smoke a shisha pipe, henna painting, Arabian makeover and a photography session with a falcon
Ride on a camel caravan and also opt to ride quad bikes through the desert
Watch the Tanoura, Fire Show, & Ladies Khaliji dance
Enjoy a wonderful stargazing session with a telescope and

admire the night sky

HTTP Public-Key-Pins Security Header Not Detected — port 443 / tcp

PCI COMPLIANCE STATUS

PASS

VULNERABILITY DETAILS

Severity:	1
QID:	48002
Category:	Information gathering
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2021-07-12 15:16:39.0

THREAT:
HTTP Public Key Pinning (HPKP) is a security feature that tells a web client to associate a specific cryptographic public key with a certain web server to decrease the risk of MITM attacks with forged certificates.

QID Detection Logic:
This QID detects the absence of the Public-Key-Pins HTTP header by transmitting a GET request.

IMPACT:
N/A

SOLUTION:
N/A

RESULT:
HTTP Public-Key-Pins Header missing on port 443.

GET / HTTP/1.1
Host: www.destinaholidays.com
Connection: Keep-Alive

Business logic abuse potential due to presence of external domains detected — port 80 / tcp

PCI COMPLIANCE STATUS

VULNERABILITY DETAILS

Severity:	1
QID:	150845
Category:	Web Application
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2024-10-21 20:23:02.0

THREAT:
External domains detected in the application. Using external domains in an application introduces risk by potentially exposing the application to external threats and dependencies, which can be exploited for malicious purposes such as data exfiltration, phishing, or compromise of application integrity. These vulnerabilities arise from inadequate validation, reliance on unsecured external services, and the application's failure to enforce strict security controls over external interactions.

IMPACT:
N/A

SOLUTION:
Audit external domains accessed by your application. If possible launch scans against those.

RESULT:
External domains could be involved in potential business logic abuse.

VULNERABILITY DETAILS

Severity:	1
QID:	45433
Category:	Information gathering
CVE ID:	-

Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2024-10-15 12:25:14.0

THREAT:
Nginx is a web server which can also be used as a reverse proxy, load balancer , mail proxy and HTTP cache.

QID Detection Logic:(authenticated)
This QID checks for the version from the nignx binary, the path is extracted via running processes.

QID Detection Logic:(unauthenticated)
This QID checks for the nginx web server by sending a GET / request and checking the response header.

IMPACT:
N/A

SOLUTION:
N/A

RESULT:
Nginx Web Server Detected on 443 over TCP.
Server: nginx/1.18.0 (Ubuntu)

Scan Time Limit Reached — port 80 / tcp

PCI COMPLIANCE STATUS

PASS

VULNERABILITY DETAILS

Severity:	1
QID:	150024
Category:	Web Application
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2024-06-19 06:38:13.0

THREAT:
The scan engine reached its internal time limit for this scan. The scan was stopped in order to collect and report the results so far.

IMPACT:
Not all tests have been completed. Therefore, some vulnerabilities may exist in the target application that the scanner has not yet tested. The scanner uses an iterative approach to determine the order in which entire site is tested. Links are selected in a breadth-first manner that takes into account how many connections each link has to other pages. This helps the scanner identify and test popular links first in order to have a useful coverage of the web application.

SOLUTION:
Application responsiveness is the most important factor in overall scan time. Review the average server response time reported by the scanner. Anything over 2 seconds is quite slow.

Scan time can potentially be reduced by one or more of the following methods:

- Make changes to improve the application's responsiveness.
- Increase the scan intensity setting.
- Reduce the SmartScan depth setting.

- Add redundant links configuration to reduce the number of unnecessary tests being performed.
- For applications with a large number of cookies, exclude the cookie/header tests (QIDs 150002, 150046, 150047, 150048).
- Exclude particular QIDs such as those related to XSS or SQL injection (and consequently running multiple scans with different QIDs enabled).

RESULT:
Scan stopped at established time limit in order to report results.

Scan Diagnostics — port 443 / tcp

PCI COMPLIANCE STATUS

PASS

VULNERABILITY DETAILS

Severity:	1
QID:	150021
Category:	Web Application
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2009-01-16 18:02:19.0

THREAT:
This check provides various details of the scan's performance and behavior. In some cases, this check can be used to identify problems that the scanner encountered when crawling the target Web application.

IMPACT:
The scan diagnostics data provides technical details about the crawler's performance and behavior. This information does not necessarily imply problems with the Web application.

SOLUTION:
No action is required.

RESULT:
Target web application page https://www.destinaholidays.com/ fetched. Status code:200, Content-Type:text/html, load time:619 milliseconds.

Join us on our 1 hour canal tour on our 100% electric, luxury boats.

Enjoy all the beauty that Amsterdam has to offer while enjoying a drink. All our boats have a bar on board where drinks can be bought. During the tour our crew will tell you about the history of Amsterdam and the sights you pass.

During summer, when the weather is mainly sunny and dry, the tour will take place on one of our luxurious open boats. On the other hand, if it happens to be rainy or cold on the canals, we will be very happy to host the tour on one of our beautiful and warm saloon boats.

In order to ensure you a spot on the boat, we advise you to book your ticket online in advanced."><meta _ngcontent-sc104="" itemprop="mpn" content="75227P1"><div _ngcontent-sc104="" itemprop="brand" itemtype="http://schema.org/Brand" itemscope=""><meta _ngcontent-sc104="" itemprop="name" content="Destina holidays"> <div _ngcontent-sc104="" class="col-md-12 no-border"><div _ngcontent-sc104="" class="c_card"><div _ngcontent-sc104="" class="card-img"><img _ngcontent-sc104="" class="img-fluid"> <div _ngcontent-sc104="" class="card-body"><div _ngcontent-sc104="" class="card-title">Flagship Amsterdam Open Boat Canal Cruise - Local live guide with bar on board <div _ngcontent-sc104="" itemprop="aggregateRating" itemtype="http://schema.org/AggregateRating" itemscope="" class="card-subtitle"><span _ngcontent-sc104="" class="pe-1"><i _ngcontent-sc104="" class="fas fa-star checked"></i><span _ngcontent-sc104="" class="pe-1"><i _ngcontent-sc104="" class="fas fa-star checked"></i><span _ngcontent-sc104="" class="pe-1"><i _ngcontent-sc104="" class="fas fa-star checked"></i><span _ngcontent-sc104="" class="pe-1"><i _ngcontent-sc104="" class="fas fa-star checked"></i><span _ngcontent-sc104="" class="pe-1"><i _ngcontent-sc104="" class="fas fa-star checked"></i><!----><!----><span _ngcontent-sc104="" class="gray"> 15407 <meta _ngcontent-sc104="" itemprop="reviewCount" content="15407"><meta _ngcontent-sc104="" itemprop="ratingValue" content="5"> <div _ngcontent-sc104="" class="card-text"><div _ngcontent-sc104="" class="row"><div _ngcontent-sc104="" class="col-md-7"><span _ngcontent-sc104="" class="pe-1"><i _ngcontent-sc104="" class="fal fa-clock"></i> 1 hour <br _ngcontent-sc104=""><i _ngcontent-sc104="" class="far fa-map"></i> Amsterdam <div _ngcontent-sc104="" itemprop="offers" itemtype="http://schema.org/Offer" itemscope="" class="col-md-5 text-end card-price"><link _ngcontent-sc104="" itemprop="url" href="/tours/Netherlands/Amsterdam/75227P1"><meta _ngcontent-sc104="" itemprop="availability" content="https://schema.org/InStock"><meta _ngcontent-sc104="" itemprop="price" content="22"><meta _ngcontent-sc104="" itemprop="offerCount" content="1"><meta _ngcontent-sc104="" itemprop="priceCurrency" content="USD"><meta _ngcontent-sc104="" itemprop="priceValidUntil" content="2026-2-12"><span _ngcontent-sc104="" class="price"> $22 ^{USD} <div _ngcontent-sc104="" class="item"><div _ngcontent-sc104="" itemtype="http://schema.org/Product" itemscope="" class="row no-gutters recommended-card"><meta _ngcontent-sc104="" itemprop="name" content="Flagship Canal Cruise in Classic Boat - Live guide with drinks & Dutch cheese"><link _ngcontent-sc104="" itemprop="image" href="https://media.tacdn.com/media/attractions-splice-spp-674x446/09/3a/8a/80.jpg"><meta _ngcontent-sc104="" itemprop="description" content="On this 1 hour Luxury Classic River Boat Cruise, you will explore the city, its famous landmarks, culture, and rich trading history whilst relaxing with a drink in your hand. SSL Session Caching Information — port 443 / tcp over ssl

PCI COMPLIANCE STATUS

PASS

VULNERABILITY DETAILS

Severity:	1
QID:	38291
Category:	General remote services
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2020-03-19 22:48:23.0

THREAT:
SSL session is a collection of security parameters that are negotiated by the SSL client and server for each SSL connection. SSL session caching is targeted to reduce the overhead of negotiations in recurring SSL connections. SSL sessions can be reused to resume an earlier connection or to establish multiple simultaneous connections. The client suggests an SSL session to be reused by identifying the session with a Session-ID during SSL handshake. If the server finds it appropriate to reuse the session, then they both proceed to secure communication with already known security parameters.

This test determines if SSL session caching is enabled on the host.

IMPACT:
SSL session caching is part of the SSL and TLS protocols and is not a security threat. The result of this test is for informational purposes only.

SOLUTION:
N/A

RESULT:
TLSv1.2 session caching is enabled on the target.
TLSv1.3 session caching is enabled on the target.

Referrer-Policy HTTP Security Header Not Detected — port 443 / tcp

PCI COMPLIANCE STATUS

PASS

VULNERABILITY DETAILS

Severity:	1
QID:	48131
Category:	Information gathering

CVE ID:	-
Vendor Reference:	Referrer-Policy
Bugtraq ID:	-
Last Update:	2023-01-18 13:30:16.0

THREAT:

No Referrer Policy is specified for the link. It checks for one of the following Referrer Policy in the response headers:

1) no-referrer
2) no-referrer-when-downgrade
3) same-origin
4) origin
5) origin-when-cross-origin
6) strict-origin
7) strict-origin-when-cross-origin

QID Detection Logic(Unauthenticated):

If the Referrer Policy header is not found , checks in response body for meta tag containing tag name as "referrer" and one of the above Referrer Policy.

IMPACT:

The Referrer-Policy header controls how much referrer information is sent to a site when navigating to it. Absence of Referrer-Policy header can lead to leakage of sensitive information via the referrer header.

SOLUTION:

Referrer Policy header improves security by ensuring websites don't leak sensitive information via the referrer header. It's recommended to add secure Referrer Policies as a part of a defense-in-depth approach.

References:

Links Rejected By Crawl Scope or Exclusion List — port 443 / tcp

PCI COMPLIANCE STATUS

QID:	150020
Category:	Web Application
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2022-02-07 16:48:28.0

THREAT:
One or more links were not crawled because of an explicit rule to exclude them. This also occurs if a link is malformed.

Exclude list and Include list entries can cause links to be rejected. If a scan is limited to a specific starting directory, then links outside that directory will neither be crawled or tested.

Links that contain a host name or IP address different from the target application are considered external links and not crawled by default; those types of links are not listed here. This often happens when the scope of a scan is limited to the directory of the starting URL. The scope can be changed in the Web Application Record.

During the test phase, some path-based tests may be rejected if the scan is limited to the directory of the starting URL and the test would fall outside that directory. In these cases, the number of rejected links may be too high to list in the Results section.

IMPACT:
Links listed here were neither crawled or tested by the Web application scanning engine.

SOLUTION:
A link might have been intentionally matched by a exclude or include list entry. Verify that no links in this list were unintentionally rejected.

RESULT:
Links not permitted:
(This list includes links from QIDs: 150010,150041,150143,150170)

External links discovered:

This information was returned from: 1) the WHOIS service, or 2) the infrastructure provided by the closest gateway server to our cloud platform. If your ISP is routing traffic, your ISP's gateway server returned this information.

THREAT:
External domains detected in the application. Using external domains in an application introduces risk by potentially exposing the application to external threats and dependencies, which can be exploited for malicious purposes such as data exfiltration, phishing, or compromise of application integrity. These vulnerabilities arise from inadequate validation, reliance on unsecured external services, and the application's failure to enforce strict security controls over external interactions.

IMPACT:
N/A

SOLUTION:
Audit external domains accessed by your application. If possible launch scans against those.

RESULT:
External domains could be involved in potential business logic abuse.

THREAT:
TCP Initial Sequence Numbers (ISNs) obtained in the SYNACK replies from the host are analyzed to determine how random they are. The average change between subsequent ISNs and the standard deviation from the average are displayed in the RESULT section. Also included is the degree of difficulty for exploitation of the TCP ISN generation scheme used by the host.

IMPACT:
N/A

SOLUTION:
N/A

RESULT:
Average change between subsequent TCP initial sequence numbers is 1060369692 with a standard deviation of 647823161. These TCP initial sequence numbers were

triggered by TCP SYN probes sent to the host at an average rate of 1/(5089 microseconds). The degree of difficulty to exploit the TCP initial sequence number generation scheme is: hard.

SSH Algorithms ChaCha20-Poly1305 or CBC-EtM Detected

Category:	Information gathering
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2024-07-03 11:01:23.0

THREAT:
The ChaCha20-Poly1305 algorithm and the CBC-EtM algorithm are known to be vulnerable to the SSH Prefix Truncation Vulnerability (Terrapin).

QID Detection Logic (Unauthenticated):
This detection attempts to start the SSH key exchange process and examines whether either of the vulnerable ChaCha20-Poly1305 Algorithm or CBC-EtM Algorithm is active. Please note that this is an Information Gathering QID and does not check if a target is vulnerable, as this does not checks for Strict Key Exchange. Customers are advised to refer to QID 38913 to detect vulnerable assets.

IMPACT:
The algorithms are known to be vulnerable to the SSH Prefix Truncation Vulnerability (Terrapin). Successful exploitation of the vulnerability may allow an attacker to downgrade the security of an SSH connection when using SSH extension negotiation. The impact in practice heavily depends on the supported extensions. Most commonly, this will impact the security of client authentication when using an RSA public key.

SOLUTION:

THREAT:

The Host Scan Time is the period of time it takes the scanning engine to perform the vulnerability assessment of a single target host. The Host Scan Time for this host is reported in the Result section below.

The Host Scan Time does not have a direct correlation to the Duration time as displayed in the Report Summary section of a scan results report. The Duration is the period of time it takes the service to perform a scan task. The Duration includes the time it takes the service to scan all hosts, which may involve parallel scanning. It also includes the time it takes for a scanner appliance to pick up the scan task and transfer the results back to the service's Secure Operating Center. Further, when a scan task is distributed across multiple scanners, the Duration includes the time it takes to perform parallel host scanning on all scanners.

CVE ID:	-

THREAT:

Scan activity per port is an estimate of the amount of internal process time the scanner engine spent scanning a particular TCP or UDP port. This information can be useful to determine the reason for long scan times. The individual time values represent internal process time, not elapsed time, and can be longer than the total scan time because of internal parallelism. High values are often caused by slowly responding services or services on which requests time out.

Referrer-Policy HTTP Security Header Not Detected — port 80 / tcp

PCI COMPLIANCE STATUS

PASS

VULNERABILITY DETAILS

Severity:	1
QID:	48131
Category:	Information gathering
CVE ID:	-
Vendor Reference:	Referrer-Policy
Bugtraq ID:	-
Last Update:	2023-01-18 13:30:16.0

THREAT:
No Referrer Policy is specified for the link. It checks for one of the following Referrer Policy in the response headers:

1) no-referrer
2) no-referrer-when-downgrade
3) same-origin
4) origin
5) origin-when-cross-origin
6) strict-origin
7) strict-origin-when-cross-origin

QID Detection Logic(Unauthenticated):
If the Referrer Policy header is not found , checks in response body for meta tag containing tag name as "referrer" and one of the above Referrer Policy.

IMPACT:
The Referrer-Policy header controls how much referrer information is sent to a site when navigating to it. Absence of Referrer-Policy header can lead to leakage of sensitive information via the referrer header.

SOLUTION:
Referrer Policy header improves security by ensuring websites don't leak sensitive information via the referrer header. It's recommended to add secure Referrer Policies as a part of a defense-in-depth approach.

References:

- https://developer.mozilla.org/en-US/docs/Web/HTTP/Headers/Referrer-Policy

RESULT:
Referrer-Policy HTTP Header missing on 80 port.

CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2024-10-15 22:36:08.0

THREAT:
Using resources from external locations is a security concern, including third-party stylesheet. Also detection of all external resources would be a requirement for certifications and audits.

IMPACT:
Using css from untrusted sources can result in external CSS injection and allow attacker to gain sensitive information.

SOLUTION:
Verify all the external CSS loaded on application are valid and from known sources.

THREAT:

Nginx is a web server which can also be used as a reverse proxy, load balancer , mail proxy and HTTP cache.

QID Detection Logic:(authenticated)

This QID checks for the version from the nignx binary, the path is extracted via running processes.

QID Detection Logic:(unauthenticated)

This QID checks for the nginx web server by sending a GET / request and checking the response header.

IMPACT:

Category:	General remote services
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2024-09-20 19:30:41.0

THREAT:

SSH is a secure protocol, provided it is fully patched, properly configured, and uses FIPS approved algorithms.

Supported ciphers suites reported in this qid are in server-preferred order.

```
For Red Hat ES 4:-
SSH1 supported                              yes
Supported authentification methods for SSH1     RSA,password
Supported ciphers for SSH1                  3des,blowfish
SSH2 supported                              yes
Supported keys exchange algorithm for SSH2      diffie-hellman-group-exchange-sha1,diffie-hellman-group14-sha1,diffie-hellman-
Supported decryption ciphers for SSH2           aes128-cbc,3des-cbc,blowfish-cbc,cast128-cbc,arcfour,aes192-cbc,aes256-cbc,rij
```

```
Supported encryption ciphers for SSH2          aes128-cbc,3des-cbc,blowfish-cbc,cast128-cbc,arcfour,aes192-cbc,aes256-cbc,rij
Supported decryption mac for SSH2              hmac-md5,hmac-sha1,hmac-ripemd160,hmac-ripemd160@openssh.com,hmac-sha1-96,hmac
Supported encryption mac for SSH2              hmac-md5,hmac-sha1,hmac-ripemd160,hmac-ripemd160@openssh.com,hmac-sha1-96,hmac
Supported authentification methods for SSH2    publickey,gssapi-with-mic,password
```

IMPACT:
Successful exploitation allows an attacker to execute arbitrary commands on the SSH server or otherwise subvert an encrypted SSH channel with arbitrary data.

SOLUTION:
SSH version 2 is preferred over SSH version 1.

RESULT:

SSH1 supported no
SSH2 supported yes
Supported key exchange algorithms for SSH2 curve25519-sha256,curve25519-sha256@libssh.org,ecdh-sha2-nistp256,ecdh-sha2-nistp384,ecdh-sha2-nistp521,sntrup761x25519-sha512@openssh.com,diffie-hellman-group-exchange-sha256,diffie-hellman-group16-sha512,diffie-hellman-group18-sha512,diffie-hellman-group14-sha256,kex-strict-s-v00@openssh.com

Web Server Supports HTTP Request Pipelining — port 8080 / tcp

PCI COMPLIANCE STATUS

PASS

VULNERABILITY DETAILS

Severity:	1
QID:	86565
Category:	Web server
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2005-02-23 00:25:38.0

THREAT:
Version 1.1 of the HTTP protocol supports URL-Request Pipelining. This means that instead of using the "Keep-Alive" method to keep the TCP connection alive over multiple requests, the protocol allows multiple HTTP URL requests to be made in the same TCP packet. Any Web server which is HTTP 1.1 compliant should then process all the URLs requested in the single TCP packet and respond as usual.

The target Web server was found to support this functionality of the HTTP 1.1 protocol.

IMPACT:
Support for URL-Request Pipelining has interesting consequences. For example, as explained in this paper by Daniel Roelker, it can be used for evading detection by Intrusion Detection Systems. Also, it can be used in HTTP Response-Spliting style attacks.

Links Rejected By Crawl Scope or Exclusion List — port 80 / tcp

PCI COMPLIANCE STATUS

PASS

VULNERABILITY DETAILS

Severity:	1
QID:	150020
Category:	Web Application
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2022-02-07 16:48:28.0

THREAT:
One or more links were not crawled because of an explicit rule to exclude them. This also occurs if a link is malformed.

Exclude list and Include list entries can cause links to be rejected. If a scan is limited to a specific starting directory, then links outside that directory will neither be crawled or tested.

Links that contain a host name or IP address different from the target application are considered external links and not crawled by default; those types of links are not listed here. This often happens when the scope of a scan is limited to the directory of the starting URL. The scope can be changed in the Web Application Record.

During the test phase, some path-based tests may be rejected if the scan is limited to the directory of the starting URL and the test would fall outside that directory. In these cases, the number of rejected links may be too high to list in the Results section.

IMPACT:
Links listed here were neither crawled or tested by the Web application scanning engine.

SOLUTION:
A link might have been intentionally matched by a exclude or include list entry. Verify that no links in this list were unintentionally rejected.

RESULT:
Links not permitted:

Category:	TCP/IP
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2024-12-19 13:22:09.0

THREAT:
The port scanner enables unauthorized users with the appropriate tools to draw a map of all services on this host that can be accessed from the Internet. The test was carried out with a "stealth" port scanner so that the server does not log real connections.

The Results section displays the port number (Port), the default service listening on the port (IANA Assigned Ports/Services), the description of the service (Description) and the service that the scanner detected using service discovery (Service Detected).

IMPACT:
Unauthorized users can exploit this information to test vulnerabilities in each of the open services.

SOLUTION:
Shut down any unknown or unused service on the list. If you have difficulty figuring out which service is provided by which process or program, contact your provider's support team. For more information about commercial and open-source Intrusion Detection Systems available for detecting port scanners of this kind, visit the CERT Web site.

QID:	150845
Category:	Web Application
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2024-10-21 20:23:02.0

THREAT:
External domains detected in the application. Using external domains in an application introduces risk by potentially exposing the application to external threats and dependencies, which can be exploited for malicious purposes such as data exfiltration, phishing, or compromise of application integrity. These vulnerabilities arise from inadequate validation, reliance on unsecured external services, and the application's failure to enforce strict security controls over external interactions.

IMPACT:
N/A

SOLUTION:
Audit external domains accessed by your application. If possible launch scans against those.

RESULT:
External domains could be involved in potential business logic abuse.

Links Rejected By Crawl Scope or Exclusion List — port 443 / tcp

PCI COMPLIANCE STATUS

PASS

VULNERABILITY DETAILS

Severity:	1
QID:	150020
Category:	Web Application
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2022-02-07 16:48:28.0

THREAT:
One or more links were not crawled because of an explicit rule to exclude them. This also occurs if a link is malformed.

Exclude list and Include list entries can cause links to be rejected. If a scan is limited to a specific starting directory, then links outside that directory will neither be crawled or tested.

Links that contain a host name or IP address different from the target application are considered external links and not crawled by default; those types of links are not listed here. This often happens when the scope of a scan is limited to the directory of the starting URL. The scope can be changed in the Web Application Record.

During the test phase, some path-based tests may be rejected if the scan is limited to the directory of the starting URL and the test would fall outside that directory. In these cases, the number of rejected links may be too high to list in the Results section.

IMPACT:
Links listed here were neither crawled or tested by the Web application scanning engine.

SOLUTION:
A link might have been intentionally matched by a exclude or include list entry. Verify that no links in this list were unintentionally rejected.

RESULT:
Links not permitted:

Web Server Supports HTTP Request Pipelining — port 80 / tcp

Category:	Web server
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2005-02-23 00:25:38.0

THREAT:
Version 1.1 of the HTTP protocol supports URL-Request Pipelining. This means that instead of using the "Keep-Alive" method to keep the TCP connection alive over multiple requests, the protocol allows multiple HTTP URL requests to be made in the same TCP packet. Any Web server which is HTTP 1.1 compliant should then process all the URLs requested in the single TCP packet and respond as usual.

The target Web server was found to support this functionality of the HTTP 1.1 protocol.

IMPACT:
Support for URL-Request Pipelining has interesting consequences. For example, as explained in this paper by Daniel Roelker, it can be used for evading detection by Intrusion Detection Systems. Also, it can be used in HTTP Response-Spliting style attacks.

Category:	Web server
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-

Last Update:	2006-07-11 16:04:25.0

THREAT:
Apache installs foreign language files along with index.html. The files are as follows:

index.html.ca
index.html.de
index.html.dk
index.html.ee

An attacker can get additional information about the Web server from these files.

IMPACT:
Sensitive system information may be disclosed, which can be utilized by an attacker to aid further attacks.

SOLUTION:
Apache recommends to remove these files from the Web server.

THREAT:
The following is a list of detected SSL/TLS protocol properties.

IMPACT:
Items include:

- Extended Master Secret: indicates whether the extended_master_secret extension is supported or required by the server. This extension enhances security and is recommended. Applicable to TLSv1, TLSv1.1, TLSv1.2, DTLSv1, DTLSv1.2
- Encrypt Then MAC: indicates whether the encrypt_then_mac extension is supported or required by the server. This extension enhances the security of non-AEAD ciphers and is recommended. Applicable to TLSv1, TLSv1.1, TLSv1.2, DTLSv1, DTLSv1.2
- Heartbeat: indicates whether the heartbeat extension is supported. It is not recommended to enable this, except for DTLS. Applicable to TLSv1, TLSv1.1, TLSv1.2, TLSv1.3, DTLSv1, DTLSv1.2
- Truncated HMAC: indicates whether the truncated_hmac extension is supported. This can degrade security and is not recommended. Applicable to TLSv1, TLSv1.1, TLSv1.2, DTLSv1, DTLSv1.2
- Cipher priority: indicates whether client, server or both determine the priority of ciphers. Having the server determine the priority is recommended. Applicable to SSLv3, TLSv1, TLSv1.1, TLSv1.2, TLSv1.3, DTLSv1, DTLSv1.2

SOLUTION:

CVE ID:	-

Bugtraq ID:	-
Last Update:	2016-03-21 16:40:23.0

THREAT:
Secure Socket Layer (SSL) and Transport Layer Security (TLS) renegotiation are vulnerable to an attack in which the attacker forms a TLS connection with the target server, injects content of his choice, and then splices in a new TLS connection from a client. The server treats the client's initial TLS handshake as a renegotiation and thus believes that the initial data transmitted by the attacker is from the same entity as the subsequent client data. TLS protocol was extended to cryptographically tierenegotiations to the TLS connections they are being performed over. This is referred to as TLS secure renegotiation extension. This detection determines whether the TLS secure renegotiation extension is supported by the server or not.

THREAT:
Nginx is a web server which can also be used as a reverse proxy, load balancer , mail proxy and HTTP cache.

QID Detection Logic:(authenticated)
This QID checks for the version from the nignx binary, the path is extracted via running processes.

QID Detection Logic:(unauthenticated)
This QID checks for the nginx web server by sending a GET / request and checking the response header.

Secure Sockets Layer (SSL) Certificate Transparency Information — port 443 / tcp over ssl

Category:	General remote services
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2021-06-08 21:07:04.0

THREAT:

SSL Certificate Transparency is an industry effort to improve visibility into the process of how certificate authorities issue certificates. It is designed to allow the owners of domain names to find all certificates that have been issued for their domains, and which certificate authorities have issued them. This is done by requiring certificate authorities to publish all issued certificates in public logs. TLS servers can then provide cryptographic evidence to TLS clients that the server certificate has been registered in public logs, thus providing some degree of confidence that the certificate is legitimate. Such cryptographic evidence is referred to as an "SCT Log Proof".

The information below lists all validated SCT Log Proofs for server certificates along with information about the public log, where available.

THREAT:
The information shown in the Result section was returned by the network infrastructure responsible for routing traffic from our cloud platform to the target network (where the scanner appliance is located).

This information was returned from: 1) the WHOIS service, or 2) the infrastructure provided by the closest gateway server to our cloud platform. If your ISP is routing traffic, your ISP's gateway server returned this information.

Category:	Web server
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2020-08-25 06:21:49.0

THREAT:
The Web server uses plain-text form based authentication. A web page exists on the target host which uses an HTML login form. This data is sent from the client to the server in plain-text.

IMPACT:
An attacker with access to the network traffic to and from the target host may be able to obtain login credentials for other users by sniffing the network traffic.

SOLUTION:
Please contact the vendor of the hardware/software for a possible fix for the issue. For custom applications, ensure that data sent via HTML login forms is encrypted before being sent from the client to the host.

CVSS Temporal Score:	**3.5** E:U/RL:U/RC:UR
Severity:	**2**
QID:	11827
Category:	CGI
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2025-01-02 19:23:28.0

THREAT:

This QID reports the absence of the following HTTP headers according to CWE-693: Protection Mechanism Failure:
X-Content-Type-Options: This HTTP header will prevent the browser from interpreting files as a different MIME type to what is specified in the Content-Type HTTP header.
Strict-Transport-Security: The HTTP Strict-Transport-Security response header (HSTS) allows web servers to declare that web browsers (or other complying user agents) should only interact with it using secure HTTPS connections, and never via the insecure HTTP protocol.

QID Detection Logic:
This unauthenticated QID will send a GET request sent to '/' (default) endpoint and looks for the presence of the following HTTP Headers in the received response:
The Valid directives are as belows: X-Content-Type-Options: nosniff

Strict-Transport-Security: max-age=< [;includeSubDomains]

IMPACT:

Depending on the vulnerability being exploited, an unauthenticated remote attacker could conduct cross-site scripting, clickjacking or MIME-type sniffing attacks.

SOLUTION:

Note: To better debug the results of this QID, it is requested that customers execute commands to simulate the following functionality: curl -lkL --verbose.

CWE-693: Protection Mechanism Failure mentions the following - The product does not use or incorrectly uses a protection mechanism that provides sufficient defense against directed attacks against the product. A "missing" protection mechanism occurs when the application does not define any mechanism against a certain class of attack. An "insufficient" protection mechanism might provide some defenses - for example, against the most common attacks - but it does not protect against everything that is intended. Finally, an "ignored" mechanism occurs when a mechanism is available and in active use within the product, but the developer has not applied it in some code path.

Customers are advised to set proper X-Content-Type-Options and Strict-Transport-Security HTTP response headers.

Depending on their server software, customers can set directives in their site configuration or Web.config files. Few examples are:

X-Content-Type-Options:
Apache: Header always set X-Content-Type-Options: nosniff

HTTP Strict-Transport-Security:
Apache: Header always set Strict-Transport-Security "max-age=31536000; includeSubDomains"
Nginx: add_header Strict-Transport-Security max-age=31536000;

Note: Network devices that include a HTTP/HTTPS console for administrative/management purposes often do not include all/some of the security headers. This is a known issue and it is recommend to contact the vendor for a solution.

RESULT:

X-Content-Type-Options HTTP Header missing on port 80.

Apache2 Default Page

It works!

This is the default welcome page used to test the correct
operation of the Apache2 server after installation on Ubuntu systems.
It is based on the equivalent page on Debian, from which the Ubuntu Apache
packaging is derived.
If you can read this page, it means that the Apache HTTP server installed at
this site is working properly. You should replace this file (located at
<tt>/var/www/html/index.html</tt>) before continuing to operate your HTTP server.

If you are a normal user of this web site and don't know what this page is
about, this probably means that the site is currently unavailable due to
maintenance.
If the problem persists, please contact the site's administrator.

Configuration Overview

Ubuntu's Apache2 default configuration is different from the
upstream default configuration, and split into several files optimized for
interaction with Ubuntu tools. The configuration system is
fully documented in
/usr/share/doc/apache2/README.Debian.gz. Refer to this for the full
documentation. Documentation for the web server itself can be
found by accessing the manual if the <tt>apache2-doc</tt>
package was installed on this server.

The configuration layout for an Apache2 web server installation on Ubuntu systems is as follows:

<pre>
/etc/apache2/
|-- apache2.conf
| `-- ports.conf
|-- mods-enabled
| |-- *.load

| `-- *.conf
|-- conf-enabled
| `-- *.conf
|-- sites-enabled
| `-- *.conf
</pre>

<tt>apache2.conf</tt> is the main configuration
file. It puts the pieces together by including all remaining configuration
files when starting up the web server.

<tt>ports.conf</tt> is always included from the
main configuration file. It is used to determine the listening ports for
incoming connections, and this file can be customized anytime.

Configuration files in the <tt>mods-enabled/</tt>,
<tt>conf-enabled/</tt> and <tt>sites-enabled/</tt> directories contain
particular configuration snippets which manage modules, global configuration
fragments, or virtual host configurations, respectively.

They are activated by symlinking available
configuration files from their respective
*-available/ counterparts. These should be managed
by using our helpers
<tt>
a2enmod,
a2dismod,
</tt>
<tt>
a2ensite,
a2dissite,
</tt>
and
<tt>
a2enconf,
a2disconf
</tt>. See their respective man pages for detailed information.

The binary is called apache2 and is managed using systemd, so to
start/stop the service use <tt>systemctl start apache2</tt> and
<tt>systemctl stop apache2</tt>, and use <tt>systemctl status apache2</tt>
and <tt>journalctl -u apache2</tt> to check status. <tt>system</tt>
and <tt>apache2ctl</tt> can also be used for service management if
desired.
Calling <tt>/usr/bin/apache2</tt> directly will not work with the
default configuration.

TCP Sequence Number Approximation Based Denial of Service

PCI COMPLIANCE STATUS

PCI Severity Level: MED

PASS

The vulnerability is purely a denial-of-service (DoS) vulnerability.

VULNERABILITY DETAILS

CVSS Base Score:	**5.0** AV:N/AC:L/Au:N/C:N/I:N/A:P
CVSS Temporal Score:	**4.3** E:F/RL:T/RC:C
Severity:	**3**
QID:	82054
Category:	TCP/IP
CVE ID:	CVE-2004-0230
Vendor Reference:	-
Bugtraq ID:	10183
Last Update:	2024-02-29 00:00:01.0

THREAT:

TCP provides stateful communications between hosts on a network. TCP sessions are established by a three-way handshake and use random 32-bit sequence and acknowledgement numbers to ensure the validity of traffic. A vulnerability was reported that may permit TCP sequence numbers to be more easily approximated by remote attackers. This issue affects products released by multiple vendors.

The cause of the vulnerability is that affected implementations will accept TCP sequence numbers within a certain range, known as the acknowledgement range, of the expected sequence number for a packet in the session. This is determined by the TCP window size, which is negotiated during the three-way handshake for the session. Larger TCP window sizes may be set to allow for more throughput, but the larger the TCP window size, the more probable it is to guess a TCP sequence number that falls within an acceptable range. It was initially thought that guessing an acceptable sequence number was relatively difficult for most implementations given random distribution, making this type of attack impractical. However, some implementations may make it easier to successfully approximate an acceptable TCP sequence number, making these attacks possible with a number of protocols and implementations.

This is further compounded by the fact that some implementations may support the use of the TCP Window Scale Option, as described in RFC 1323, to extend the TCP window size to a maximum value of 1 billion.

This vulnerability will permit a remote attacker to inject a SYN or RST packet into the session, causing it to be reset and effectively allowing for denial of service attacks. An attacker would exploit this issue by sending a packet to a receiving implementation with an approximated sequence number and a forged source IP address and TCP port.

There are a few factors that may present viable target implementations, such as those which depend on long-lived TCP connections, those that have known or easily guessed IP address endpoints and those implementations with easily guessed TCP source ports. It has been noted that Border Gateway Protocol (BGP) is reported to be particularly vulnerable to this type of attack, due to the use of long-lived TCP sessions and the possibility that some implementations may use the TCP Window Scale Option. As a result, this issue is likely to affect a number of routing platforms.

Another factor to consider is the relative difficulty of injecting packets into TCP sessions, as a number of receiving implementations will reassemble packets in order, dropping any duplicates. This may make some implementations more resistant to attacks than others.

It should be noted that while a number of vendors have confirmed this issue in various products, investigations are ongoing and it is likely that many other vendors and products will turn out to be vulnerable as the issue is investigated further.

IMPACT:

Successful exploitation of this issue could lead to denial of service attacks on the TCP based services of target hosts.

SOLUTION:

Please first check the results section below for the port number on which this vulnerability was detected. If that port number is known to be used for port-forwarding, then it is the backend host that is really vulnerable.

Various implementations and products including Check Point, Cisco, Cray Inc, Hitachi, Internet Initiative Japan, Inc (IIJ), Juniper Networks, NEC and Yamaha are currently undergoing review. Contact the vendors to obtain more information about affected products and fixes. NISCC Advisory 236929 - Vulnerability Issues in TCP details the vendor patch status as of the time of the advisory, and identifies resolutions and workarounds.

Refer to US-CERT Vulnerability Note VU#415294 and OSVDB Article 4030 to obtain a list of vendors affected by this issue and a note on resolutions (if any) provided by the vendor.

For Microsoft: Refer to MS05-019 and MS06-064 for further details.

For SGI IRIX: Refer to SGI Security Advisory 20040905-01-P

For SCO UnixWare 7.1.3 and 7.1.1: Refer to SCO Security Advisory SCOSA-2005.14

For Solaris (Sun Microsystems): The vendor has acknowledged the vulnerability; however a patch is not available. Refer to Sun Microsystems, Inc. Information for VU#415294 to obtain additional details. Also, refer to TA04-111A for detailed mitigating strategies against these attacks.

For NetBSD: Refer to NetBSD-SA2004-006

For Cisco: Refer to cisco-sa-20040420-tcp-ios.shtml.

For IBM : Refer to IBM-tcp-sequence-number-cve-2004-0230.

For Red Hat Linux: There is no fix available : Refer to .

Workaround:
The following BGP-specific workaround information has been provided.

For BGP implementations that support it, the TCP MD5 Signature Option should be enabled. Passwords that the MD5 checksum is applied to should be set to strong values and changed on a regular basis.

Secure BGP configuration instructions have been provided for Cisco and Juniper at these locations:
Secure Cisco IOS BGP Template
JUNOS Secure BGP Template

RESULT:
Tested on port 80 with an injected SYN/RST offset by 16 bytes.

AutoComplete Attribute Not Disabled for Password in Form Based Authentication — port 80 / tcp

PCI COMPLIANCE STATUS

PCI Severity Level: LOW

PASS — The vulnerability is not included in the NVD.

VULNERABILITY DETAILS

CVSS Base Score:	**2.6** AV:N/AC:H/Au:N/C:P/I:N/A:N
CVSS Temporal Score:	**2.0** E:U/RL:U/RC:UC
Severity:	**2**
QID:	86729
Category:	Web server
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2021-12-01 13:30:46.0

THREAT:
The Web server allows form based authentication without disabling the AutoComplete feature for the password field.

Autocomplete should be turned off for any input that takes sensitive information such as credit card number, CVV2/CVC code, U.S. social security number, etc.

IMPACT:
If the browser is used in a shared computing environment where more than one person may use the browser, then "autocomplete" values may be retrieved or submitted by an unauthorized user.

SOLUTION:
Contact the vendor to have the AutoComplete attribute disabled for the password field in all forms. The AutoComplete attribute should also be disabled for the user ID field.

Developers can add the following attribute to the form or input element: autocomplete="off"
This attribute prevents the browser from prompting the user to save the populated form values for later reuse.
Most browsers no longer honor autocomplete="off" for password input fields. These browsers include Chrome, Firefox, Microsoft Edge, IE, Opera
However, there is still an ability to turn off autocomplete through the browser and that is recommended for a shared computing environment.
Since the ability to turn autocomplete off for password inputs fields is controlled by the user it is highly recommended for application to enforce strong password rules.

Last Update:	2024-09-05 18:25:56.0

THREAT:
The SSH protocol (Secure Shell) is a method for secure remote login from one computer to another. The target is using deprecated SHA1 cryptographic settings to communicate.

IMPACT:
vulnerable to collision attacks, which are designed to fabricate the same hash value for different input data.each hash is supposedly unique.

SOLUTION:
Avoid using deprecated cryptographic settings.

Use best practices when configuring SSH.

Refer to NIST Retires SHA-1 Cryptographic Algorithm (SSH) .

CVE ID:	CVE-2023-28531
Vendor Reference:	OpenSSH Advisory
Bugtraq ID:	-
Last Update:	2024-12-11 13:21:59.0

THREAT:

OpenSSH (OpenBSD Secure Shell) is a set of computer programs providing encrypted communication sessions over a computer network using the SSH protocol.

Affected Versions:

OpenSSH version 8.9 and above prior to 9.3

QID Detection Logic:

This unauthenticated detection works by reviewing the version of the OpenSSH service.

IMPACT:

Successfully exploitation of this vulnerability could lead to disclosure of sensitive information, addition or modification of data, or Denial of Service (DoS).

SOLUTION:

Customers are advised to upgrade to OpenSSH 9.3 or later to remediate these vulnerabilities.

THREAT:

Apache HTTP Server is an HTTP web server application.

CVE-2022-28330: Apache HTTP Server 2.4.53 and earlier on Windows may read beyond bounds when configured to process requests with the mod_isapi module.
CVE-2022-28614: The ap_rwrite() function in Apache HTTP Server 2.4.53 and earlier may read unintended memory if an attacker can cause the server to reflect very large input using ap_rwrite() or ap_rputs(), such as with mod_luas r:puts() function.
CVE-2022-28615: Apache HTTP Server 2.4.53 and earlier may crash or disclose information due to a read beyond bounds in ap_strcmp_match() when provided with an extremely large input buffer.
CVE-2022-29404: In Apache HTTP Server 2.4.53 and earlier, a malicious request to a lua script that calls r:parsebody(0) may cause a denial of service due to no default limit on possible input size.
CVE-2022-30556: Apache HTTP Server 2.4.53 and earlier may return lengths to applications calling r:wsread() that point past the end of the storage allocated for the buffer.

Affected Versions:
Apache HTTP Server versions 2.4.53 and earlier

Apache Hypertext Transfer Protocol (HTTP) Server Request Smuggling Vulnerability — port 80 / tcp

PCI COMPLIANCE STATUS

PCI Severity Level: MED

VULNERABILITY DETAILS

CVSS Base Score:	**6.4** AV:N/AC:L/Au:N/C:P/I:P/A:N

Severity:	**4**
QID:	730758

CVE ID:	CVE-2023-25690
Vendor Reference:	Apache HTTP Server Security Advisory
Bugtraq ID:	-
Last Update:	2024-12-30 13:21:09.0

THREAT:

Some mod_proxy configurations on Apache HTTP Server versions 2.4.0 through 2.4.55 allow a HTTP Request Smuggling attack.

Configurations are affected when mod_proxy is enabled along with some form of RewriteRule or ProxyPassMatch in which a non-specific pattern matches some portion of the user-supplied request-target (URL) data and is then re-inserted into the proxied request-target using variable substitution.

Affected Versions:
Apache HTTP Server Versions 2.4.0 through 2.4.55 (including)

QID Detection Logic(Unauthenticated):
This QID checks for vulnerable version of Apache HTTP Server by sending a GET request to a target and extracting the version from the response header.

IMPACT:

Request splitting/smuggling could result in bypass of access controls in the proxy server, proxying unintended URLs to existing origin servers, and cache poisoning.

SOLUTION:

Customers are advised to upgrade to Apache HTTP Server version 2.4.56 or later. For more information please refer to Apache HTTP Server Security Advisory

Vendor Reference:	Apache HTTP Server
Bugtraq ID:	-
Last Update:	2024-12-13 12:00:01.0

THREAT:

The Apache HTTP Server, colloquially called Apache, is a free and open-source cross-platform web server software.

Affected versions of Apache HTTP Server has multiple vulnerabilities:

DoS by Null pointer in websocket over HTTP/2 (CVE-2024-36387): Serving WebSocket protocol upgrades over a HTTP/2 connection could result in a Null Pointer dereference, leading to a crash of the server process, degrading performance.

Windows UNC SSRF (CVE-2024-38472): SSRF in Apache HTTP Server on Windows allows to potentially leak NTML hashes to a malicious server via SSRF and malicious requests or content.
Note: Existing configurations that access UNC paths will have to configure new directive "UNCList" to allow access during request processing.

Proxy encoding problem (CVE-2024-38473): Encoding problem in mod_proxy allows request URLs with incorrect encoding to be sent to backend services, potentially bypassing authentication via crafted requests.

Weakness with encoded question marks in backreferences (CVE-2024-38474): Substitution encoding issue in mod_rewrite. Allows attacker to execute scripts in directories permitted by the configuration but not directly reachable by any URL or source disclosure of scripts meant to only to be executed as CGI.

Weakness in mod_rewrite when first segment of substitution matches filesystem path. (CVE-2024-38475): Improper escaping of output in mod_rewrite. Allows an attacker to map URLs to filesystem locations that are permitted to be served by the server but are not intentionally/directly reachable by any URL, resulting in code execution or source code disclosure.

Crash resulting in Denial of Service in mod_proxy via a malicious request (CVE-2024-38477): null pointer dereference in mod_proxy. Allows an attacker to crash the server via a malicious request.

mod_rewrite proxy handler substitution (CVE-2024-39573): Potential SSRF in mod_rewrite. Allows an attacker to cause unsafe RewriteRules to unexpectedly setup URLs to be handled by mod_proxy.

Affected Versions:
Apache HTTP Server version from 2.4.0 to 2.4.59

QID Detection Logic (Unauthenticated):
This QID sends a HTTP GET request and checks the response headers to confirm if the host is running vulnerable version of Apache HTTP Server.
IMPACT:
Successful exploitation of this vulnerability could lead to a security breach or could affect integrity, availability, and confidentiality.
SOLUTION:
Customers are advised to upgrade to the latest version of Apache HTTP Server to remediate this vulnerability. For more information related to this vulnerability please refer to Apache's Security advisory

THREAT:
Apache HTTP Server is an HTTP web server application.

CVE-2006-20001: A carefully crafted If: request header can cause a memory read, or write of a single zero byte, in a pool (heap) memory location beyond the header value sent. This could cause the process to crash.
CVE-2022-37436: A malicious backend can cause the response headers to be truncated early, resulting in some headers being incorporated into the response body. If the later headers have any security purpose, they will not be interpreted by the client.

Affected Versions:
Apache HTTP Server versions prior to 2.4.55

Vendor Reference:	OpenSSH 9.6
Bugtraq ID:	-
Last Update:	2024-12-11 13:21:59.0

THREAT:

OpenSSH is a set of computer programs providing encrypted communication sessions over a computer network using the SSH protocol.

In OpenSSH, when common types of DRAM are used, might allow row hammer attacks (for authentication bypass) because the integer value of authenticated in mm_answer_authpassword does not resist flips of a single bit.

Affected Versions:
OpenSSH up to version 9.6

QID Detection Logic:
This unauthenticated detection works by reviewing the version of the OpenSSH service.

IMPACT:

Successful exploitation allows OS command injection and row hammer attacks for authentication bypass.

SOLUTION:

There are no vendor supplied patches available at this time.

RESULT:

Vulnerable SSH-2.0-OpenSSH_8.9p1 Ubuntu-3ubuntu0.10 detected on port 22 over TCP.

THREAT:
Apache HTTP Server is an HTTP web server application.

CVE-2022-26377: Inconsistent Interpretation of HTTP Requests ('HTTP Request Smuggling') vulnerability in mod_proxy_ajp of Apache HTTP Server allows an attacker to smuggle requests to the AJP server it forwards requests to.

Affected Versions:
Apache HTTP Server versions 2.4 to 2.4.53

QID Detection Logic:(Unauthenticated)
This QID checks for server banners to detect if the target is running vulnerable version of apache httpd.
IMPACT:
Successful exploitation of this vulnerability may allows an attacker to smuggle requests to the AJP server it forwards requests to.

Last Update:	2024-11-13 18:02:42.0

THREAT:
Apache HTTP Server, colloquially called Apache, is a free and open-source cross-platform web server software.

Multiple versions of Apache HTTP Server on Windows are affected by a Server-Side Request Forgery (SSRF) Vulnerability with mod_rewrite in server/vhost context.

Affected Versions:
Apache HTTP Server versions from 2.4.0 prior to 2.4.62

QID Detection Logic (Unauthenticated):
This QID sends an HTTP GET request and checks the HTTP response headers to confirm if the host is running vulnerable version of Apache HTTP Server.

IMPACT:
Successful exploitation of this vulnerability could potentially leak NTML hashes to a malicious server via SSRF and malicious requests.

SOLUTION:
Customers are advised to upgrade to Apache HTTP Server 2.4.62 or later version to remediate this vulnerability. For more information related to this vulnerability please refer to Apache HTTP Server Security.

Vendor Reference:	Apache Security Advisory
Bugtraq ID:	-
Last Update:	2024-12-30 13:21:09.0

THREAT:
Apache HTTP Server is a free and open-source cross-platform web server software, released under the terms of Apache License 2.0.

CVE-2022-22719 - A carefully crafted request body can cause a read to a random memory area which could cause the process to crash.
CVE-2022-22720 - Apache HTTP Server 2.4.52 and earlier fails to close inbound connection when errors are encountered discarding the request body, exposing the server to HTTP Request Smuggling
CVE-2022-22721 - If LimitXMLRequestBody is set to allow request bodies larger than 350MB (defaults to 1M) on 32 bit systems an integer overflow happens which later causes out of bounds writes.
CVE-2022-23943 - Out-of-bounds Write vulnerability in mod_sed of Apache HTTP Server allows an attacker to overwrite heap memory with possibly attacker provided data.

Affected Versions:
Apache HTTP Server 2.4 - 2.4.52
IMPACT:
Successful exploitation of the vulnerability may allow an attacker to redirect victim to a malicious server.

SOLUTION:

Customers are advised to update to Apache HTTP Server 2.4.53 or later. For more information, check Apache Security Advisory

THREAT:
MySQL is an open source SQL database application available for multiple operating platforms.

An authenticated attacker, with privileges to a database that has an "_" (underscore) in the name, could grant privileges to other databases that have a similar name, that the attacker does not have privileges to.

MySQL 3.23.58 and earlier are affected.

IMPACT:
An attacker could use this vulnerability to gain elevated privileges and read or modify sensitive information in the database.

THREAT:
The Apache HTTP Server, colloquially called Apache, is a free and open-source cross-platform web server software.

Affected versions of Apache HTTP Server has multiple vulnerabilities:

HTTP response splitting (CVE-2023-38709): Faulty input validation in the core of Apache allows malicious or exploitable backend/content generators to split HTTP responses.

HTTP Response Splitting in multiple modules (CVE-2024-24795): HTTP Response splitting in multiple modules in Apache HTTP Server allows an attacker that can inject malicious response headers into backend applications to cause an HTTP desynchronization attack.

Affected Versions:
Apache HTTP Server version from 2.4.0 to 2.4.58

QID Detection Logic (Unauthenticated):
This QID sends a HTTP GET request and checks the response headers to confirm if the host is running vulnerable version of Apache HTTP Server.

IMPACT:
Successful exploitation of this vulnerability could allow attackers to split HTTP responses, which can lead to injecting harmful content or causing server issues.

Last Update:	2023-03-04 10:04:52.0

THREAT:

PhpMyAdmin is a free software tool written in PHP and intended to handle the administration of MySQL over the Internet.

An XSS vulnerability has been discovered where an authenticated user can trigger an XSS attack by uploading a specially-crafted .sql file through the drag-and-drop interface.

Affected Versions:
phpMyAdmin versions from 4.3.0 prior to 4.9.1
phpMyAdmin versions from 5.0 prior to 5.2.1

QID Detection Logic (unauthenticated):
This QID sends a HTTP GET request to "doc/html/index.html" and determines the vulnerable version of phpMyAdmin running on the target system.

IMPACT:
Successful exploitation of this vulnerability may allow an authenticated attacker to execute arbitrary JavaScript code on the target system.

SOLUTION:
Users are advised to upgrade to phpMyAdmin 5.2.1 or 4.9.11 or the latest version.Workaround:
Disable the configuration directive `$cfg['enable_drag_drop_import']`, users will be unable to use the drag and drop upload which would protect against the vulnerability.

THREAT:
The service detected a database installation on the target. Databases like Oracle, MS-SQL, MySQL, IBM DB2, PostGgresql, Firebird and other are detected. The database instance is listed in the result section below.

IMPACT:
Information disclosing database type will lead attacker to perform more targeted attacks.

SOLUTION:
Users are recommended to encrypt the database information and handle the situations where any error is leading to disclose some sensitive information like database type and its version.

RESULT:
MYSQL server instance detectedMYSQL instance detected on TCP port 3306.

Last Update:	2024-08-20 12:27:20.0

THREAT:
Apache HTTP Server is an HTTP web server application.

CVE-2023-31122: Out-of-bounds Read vulnerability in mod_macro of Apache HTTP Server.This issue affects Apache HTTP Server
CVE-2023-45802: A client could send new requests and resets, keeping the connection busy and open and causing the memory footprint to keep on growing. On connection close, all resources were reclaimed, but the process might run out of memory before that.

Affected Versions:
Apache HTTP Server versions prior to 2.4.58

QID Detection Logic:(Unauthenticated)
This QID checks for server banner to detect if the target is running vulnerable version of apache httpd.
IMPACT:
Successful exploitation of this vulnerability may result in the breach of Confidentiality, Integrity, and Availability of data.
SOLUTION:
Customers are advised to update the latest Apache HTTP Server versions 2.4.58 or later.

CVE ID:	CVE-2024-27316
Vendor Reference:	Apache HTTP Server
Bugtraq ID:	-
Last Update:	2024-09-06 12:02:48.0

THREAT:
The Apache HTTP Server, colloquially called Apache, is a free and open-source cross-platform web server software.

HTTP/2 incoming headers exceeding the limit are temporarily buffered in nghttp2 in order to generate an informative HTTP 413 response. If a client does not stop sending headers, this leads to memory exhaustion.

Affected Versions:
Apache HTTP Server version from 2.4.0 to 2.4.58

QID Detection Logic (Unauthenticated):
This QID sends a HTTP GET request and checks the response headers to confirm if the host is running vulnerable version of Apache HTTP Server.

IMPACT:
Successful exploitation of the vulnerability can allow an attacker to trigger a DoS.

SOLUTION:
Customers are advised to upgrade to the latest version of Apache HTTP Server to remediate this vulnerability. For more information related to this vulnerability please refer to Apache's Security advisory

Last Update:	2024-06-02 12:01:45.0

THREAT:
The Apache HTTP Server, colloquially called Apache, is a free and open-source cross-platform web server software.

Affected versions of Apache HTTP Server has multiple vulnerabilities:
CVE-2023-31122 : Out-of-bounds Read vulnerability in mod_macro of Apache HTTP Server
CVE-2023-43622 : DoS in HTTP/2 with initial windows size 0
CVE-2023-45802 : When a HTTP/2 stream was reset (RST frame) by a client, there was a time window were the requests memory resources were not reclaimed immediately. Instead, de-allocation was deferred to connection close. A client could send new requests and resets, keeping the connection busy and open and causing the memory footprint to keep on growing. On connection close, all resources were reclaimed, but the process might run out of memory before that.

Affected Versions:
Apache HTTP Server version from 2.4.0 to 2.4.57

Category:	General remote services
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2024-05-20 12:30:20.0

THREAT:
A remote access or remote management service was detected. If such a service is accessible to malicious users it can be used to carry different type of attacks. Malicious users could try to brute force credentials or collect additional information on the service which could enable them in crafting further attacks.

The Results section includes information on the remote access service that was found on the target.

Services like Telnet, Rlogin, SSH, windows remote desktop, pcAnywhere, Citrix Management Console, Remote Admin (RAdmin), VNC, OPENVPN and ISAKMP are checked.

IMPACT:
Consequences vary by the type of attack.

SOLUTION:
Expose the remote access or remote management services only to the system administrators or intended users of the system.

RESULT:

Host Uptime Based on TCP TimeStamp Option

PCI COMPLIANCE STATUS

PASS

VULNERABILITY DETAILS

Severity:	**2**
QID:	82063
Category:	TCP/IP
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2007-05-29 18:56:36.0

THREAT:

The TCP/IP stack on the host supports the TCP TimeStamp (kind 8) option. Typically the timestamp used is the host's uptime (since last reboot) in various units (e.g., one hundredth of second, one tenth of a second, etc.). Based on this, we can obtain the host's uptime. The result is given in the Result section below.

Some operating systems (e.g., MacOS, OpenBSD) use a non-zero, probably random, initial value for the timestamp. For these operating systems, the uptime obtained does not reflect the actual uptime of the host; the former is always larger than the latter.

IMPACT:

N/A

SOLUTION:

N/A

RESULT:

Based on TCP timestamps obtained via port 22, the host's uptime is 49 days, 14 hours, and 3 minutes.
The TCP timestamps from the host are in units of 1 milliseconds.

Category:	Web Application
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2024-07-17 05:07:15.0

THREAT:
Common file paths such as /var/www/. /var/lib/www, /usr/local/apache2, /Inetpub/wwwroot, /usr/share, etc are default web directory paths. Using such paths or directory structure and leaking information in web application leads to information disclosure about directory paths and framework in use.

IMPACT:
Public-facing web pages and code, products may store sensitive data, code that is not directly invoked, or other files under the web document root of the web server. If the server is not configured or otherwise used to prevent direct access to those files, then attackers may obtain this sensitive data. Default directory paths often have meta data, configuration files that can be read or written by a public or anonymous user.

SOLUTION:
Avoid using common web directory paths and use virtual directories.

Category:	Information gathering
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2025-02-11 13:32:02.0

THREAT:
Several different techniques can be used to identify the operating system (OS) running on a host. A short description of these techniques is provided below. The specific technique used to identify the OS on this host is included in the RESULTS section of your report.

1) **TCP/IP Fingerprint**: The operating system of a host can be identified from a remote system using TCP/IP fingerprinting. All underlying operating system TCP/IP stacks have subtle differences that can be seen in their responses to specially-crafted TCP packets. According to the results of this "fingerprinting" technique, the OS version is among those listed below.

Note that if one or more of these subtle differences are modified by a firewall or a packet filtering device between the scanner and the host, the fingerprinting technique may fail. Consequently, the version of the OS may not be detected correctly. If the host is behind a proxy-type firewall, the version of the operating system detected may be that of the firewall instead of the host being scanned.

2) **NetBIOS**: Short for Network Basic Input Output System, an application programming interface (API) that augments the DOS BIOS by adding special functions for local-area networks (LANs). Almost all LANs for PCs are based on the NetBIOS. Some LAN manufacturers have even extended it, adding additional network capabilities. NetBIOS relies on a message format called Server Message Block (SMB).

3) **PHP Info**: PHP is a hypertext pre-processor, an open-source, server-side, HTML-embedded scripting language used to create dynamic Web pages. Under some configurations it is possible to call PHP functions like phpinfo() and obtain operating system information.

4) **SNMP**: The Simple Network Monitoring Protocol is used to monitor hosts, routers, and the networks to which they attach. The SNMP service maintains Management Information Base (MIB), a set of variables (database) that can be fetched by Managers. These include "MIB_II.system.sysDescr" for the operating system.

Category:	Information gathering
CVE ID:	-

Last Update:	2024-07-03 11:01:23.0

THREAT:
The ChaCha20-Poly1305 algorithm and the CBC-EtM algorithm are known to be vulnerable to the SSH Prefix Truncation Vulnerability (Terrapin).

QID Detection Logic (Unauthenticated):
This detection attempts to start the SSH key exchange process and examines whether either of the vulnerable ChaCha20-Poly1305 Algorithm or CBC-EtM Algorithm is active. Please note that this is an Information Gathering QID and does not check if a target is vulnerable, as this does not checks for Strict Key Exchange. Customers are advised to refer to QID 38913 to detect vulnerable assets.

IMPACT:
The algorithms are known to be vulnerable to the SSH Prefix Truncation Vulnerability (Terrapin). Successful exploitation of the vulnerability may allow an attacker to downgrade the security of an SSH connection when using SSH extension negotiation. The impact in practice heavily depends on the supported extensions. Most commonly, this will impact the security of client authentication when using an RSA public key.

THREAT:

Scan activity per port is an estimate of the amount of internal process time the scanner engine spent scanning a particular TCP or UDP port. This information can be useful to determine the reason for long scan times. The individual time values represent internal process time, not elapsed time, and can be longer than the total scan time because of internal parallelism. High values are often caused by slowly responding services or services on which requests time out.

The values for the identification (ID) field in IP headers in IP packets from the host are analyzed to determine how random they are. The changes between subsequent ID values for either the network byte ordering or the host byte ordering, whichever is smaller, are displayed in the RESULT section along with the duration taken to send the probes. When incremental values are used, as is the case for TCP/IP implementation in many operating systems, these changes reflect the network load of the host at the time this test was conducted.

Apache Default Installation/Welcome Page Detected — port 80 / tcp

Category:	Information gathering
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2019-11-21 11:18:00.0

THREAT:
The Apache default installation or "Welcome" page is installed on this server. This usually indicates a newly installed server which has not yet been configured properly and which may not be known about.

Detection Logic(unauthenticated):
QID will check for the apache default Installation/Welcome Page on apache server.

IMPACT:
Apache is installed by default and the user may not be aware that the web server is running. These servers are rarely patched and rarely monitored, providing hackers with a convenient target that is not likely to trip any alarms.

SOLUTION:
Customers are recommended to disable default Apache welcome configuration.

Category:	Information gathering
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2024-12-11 13:21:59.0

THREAT:

The Apache HTTP Server Project is an effort to develop and maintain an open-source HTTP server for modern operating systems including UNIX and Windows. The goal of this project is to provide a secure, efficient and extensible server that provides HTTP services in sync with the current HTTP standards.

Apache HTTP Server was detected on the target.

QID Detection Logic (Authenticated):
Operating System: Linux
The detection looks for Apache HTTP Server installation path using ps command. The version is extracted from the Apache HTTP Server's binary.
Operating System: Windows
This QID checks Windows registry to see if Apache HTTP Server is installed. If found, it displays the installed version.

Referrer-Policy HTTP Security Header Not Detected — port 80 / tcp

PCI COMPLIANCE STATUS

PASS

VULNERABILITY DETAILS

Severity:	**1**
QID:	48131
Category:	Information gathering
CVE ID:	-
Vendor Reference:	Referrer-Policy
Bugtraq ID:	-
Last Update:	2023-01-18 13:30:16.0

THREAT:
No Referrer Policy is specified for the link. It checks for one of the following Referrer Policy in the response headers:

1) no-referrer
2) no-referrer-when-downgrade
3) same-origin
4) origin
5) origin-when-cross-origin
6) strict-origin
7) strict-origin-when-cross-origin

QID Detection Logic(Unauthenticated):
If the Referrer Policy header is not found , checks in response body for meta tag containing tag name as "referrer" and one of the above Referrer Policy.

IMPACT:
The Referrer-Policy header controls how much referrer information is sent to a site when navigating to it. Absence of Referrer-Policy header can lead to leakage of sensitive information via the referrer header.

SOLUTION:
Referrer Policy header improves security by ensuring websites don't leak sensitive information via the referrer header. It's recommended to add secure Referrer Policies as a part of a defense-in-depth approach.

Category:	Information gathering
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2020-07-20 12:24:23.0

THREAT:
This QID prints the information, in the form of a text record, that a web server sends back to a client's browser in response to receiving a single HTTP GET request.

QID Detection Logic:
This QID returns the HTTP response method and header information returned by a web server.
IMPACT:
N/A
SOLUTION:
N/A
RESULT:
HTTP header and method information collected on port 80.

Web Server Supports HTTP Request Pipelining — port 80 / tcp

PCI COMPLIANCE STATUS

PASS

VULNERABILITY DETAILS

Severity:	1
QID:	86565
Category:	Web server
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2005-02-23 00:25:38.0

THREAT:
Version 1.1 of the HTTP protocol supports URL-Request Pipelining. This means that instead of using the "Keep-Alive" method to keep the TCP connection alive over multiple requests, the protocol allows multiple HTTP URL requests to be made in the same TCP packet. Any Web server which is HTTP 1.1 compliant should then process all the URLs requested in the single TCP packet and respond as usual.

The target Web server was found to support this functionality of the HTTP 1.1 protocol.

IMPACT:
Support for URL-Request Pipelining has interesting consequences. For example, as explained in this paper by Daniel Roelker, it can be used for evading detection by Intrusion Detection Systems. Also, it can be used in HTTP Response-Spliting style attacks.

SOLUTION:
N/A

RESULT:
GET / HTTP/1.1
Host:67.220.85.36:80

GET /Q_Evasive/ HTTP/1.1

THREAT:
phpMyAdmin is a free software tool written in PHP, intended to handle the administration of MySQL over the Web. phpMyAdmin supports a wide range of operations on MySQL and MariaDB.

QID Detection Logic (Unauthenicated):
The qid sends a GET request to "doc/html/index.html" and "Documentation.html" pages to retrieve the PhpMyAdmin version.

IMPACT:

Bugtraq ID:	-
Last Update:	2013-08-15 21:12:37.0

THREAT:
The information shown in the Result section was returned by the network infrastructure responsible for routing traffic from our cloud platform to the target network (where the scanner appliance is located).

This information was returned from: 1) the WHOIS service, or 2) the infrastructure provided by the closest gateway server to our cloud platform. If your ISP is routing traffic, your ISP's gateway server returned this information.

IMPACT:
This information can be used by malicious users to gather more information about the network infrastructure that may help in launching attacks against it.

Configuration Overview
</div>
<div class="content_section_text">
<p>
Ubuntu&apos;s Apache2 default configuration is different from the
upstream default configuration, and split into several files optimized for
interaction with Ubuntu tools. The configuration system is
<b>fully documented in
/usr/share/doc/apache2/README.Debian.gz</b>. Refer to this for the full
documentation. Documentation for the web server itself can be
```

found by accessing the manual if the <tt>apache2-doc</tt>
package was installed on this server.

The configuration layout for an Apache2 web server installation on Ubuntu systems is as follows:

<pre>
/etc/apache2/
|-- apache2.conf
| `-- ports.conf
|-- mods-enabled
| |-- *.load
| `-- *.conf
|-- conf-enabled
| `-- *.conf
|-- sites-enabled
| `-- *.conf
</pre>

<tt>apache2.conf</tt> is the main configuration
file. It puts the pieces together by including all remaining configuration
files when starting up the web server.

<tt>ports.conf</tt> is always included from the
main configuration file. It is used to determine the listening ports for
incoming connections, and this file can be customized anytime.

Configuration files in the <tt>mods-enabled/</tt>,
<tt>conf-enabled/</tt> and <tt>sites-enabled/</tt> directories contain
particular configuration snippets which manage modules, global configuration
fragments, or virtual host configurations, respectively.

They are activated by symlinking available
configuration files from their respective
*-available/ counterparts. These should be managed
by using our helpers
<tt>
a2enmod,
a2dismod,
</tt>
<tt>
a2ensite,
a2dissite,
</tt>
and
<tt>
a2enconf,
a2disconf
</tt>. See their respective man pages for detailed information.

```
</li>

<li>
The binary is called apache2 and is managed using systemd, so to
start/stop the service use <tt>systemctl start apache2</tt> and
<tt>systemctl stop apache2</tt>, and use <tt>systemctl status apache2</tt>
and <tt>journalctl -u apache2</tt> to check status. <tt>system</tt>
and <tt>apache2ctl</tt> can also be used for service management if
desired.
<b>Calling <tt>/usr/bin/apache2</tt> directly will not work</b> with the
default configuration.

VULNERABILITY DETAILS

Severity: 1

QID:	82045
Category:	TCP/IP
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2004-11-19 21:53:59.0

THREAT:
TCP Initial Sequence Numbers (ISNs) obtained in the SYNACK replies from the host are analyzed to determine how random they are. The average change between subsequent ISNs and the standard deviation from the average are displayed in the RESULT section. Also included is the degree of difficulty for exploitation of the TCP ISN generation scheme used by the host.

IMPACT:
N/A

SOLUTION:
N/A

RESULT:
Average change between subsequent TCP initial sequence numbers is 791447112 with a standard deviation of 649958040. These TCP initial sequence numbers were triggered by TCP SYN probes sent to the host at an average rate of 1/(5096 microseconds). The degree of difficulty to exploit the TCP initial sequence number generation scheme is: hard.

Category:	Web Application
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2024-10-21 20:23:02.0

THREAT:
External domains detected in the application. Using external domains in an application introduces risk by potentially exposing the application to external threats and dependencies, which can be exploited for malicious purposes such as data exfiltration, phishing, or compromise of application integrity. These vulnerabilities arise from inadequate validation, reliance on unsecured external services, and the application's failure to enforce strict security controls over external interactions.

IMPACT:
N/A

SOLUTION:
Audit external domains accessed by your application. If possible launch scans against those.

RESULT:
External domains could be involved in potential business logic abuse.

THREAT:
The Host Scan Time is the period of time it takes the scanning engine to perform the vulnerability assessment of a single target host. The Host Scan Time for this host is reported in the Result section below.

The Host Scan Time does not have a direct correlation to the Duration time as displayed in the Report Summary section of a scan results report. The Duration is the period of time it takes the service to perform a scan task. The Duration includes the time it takes the service to scan all hosts, which may involve parallel scanning. It also includes the time it takes for a scanner appliance to pick up the scan task and transfer the results back to the service's Secure Operating Center. Further, when a scan task is distributed across multiple scanners, the Duration includes the time it takes to perform parallel host scanning on all scanners.

IMPACT:

Links Rejected By Crawl Scope or Exclusion List — port 80 / tcp

PCI COMPLIANCE STATUS

PASS

VULNERABILITY DETAILS

Severity:	1
QID:	150020
Category:	Web Application
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2022-02-07 16:48:28.0

THREAT:
One or more links were not crawled because of an explicit rule to exclude them. This also occurs if a link is malformed.

Exclude list and Include list entries can cause links to be rejected. If a scan is limited to a specific starting directory, then links outside that directory will neither be crawled or tested.

Links that contain a host name or IP address different from the target application are considered external links and not crawled by default; those types of links are not listed here. This often happens when the scope of a scan is limited to the directory of the starting URL. The scope can be changed in the Web Application Record.

During the test phase, some path-based tests may be rejected if the scan is limited to the directory of the starting URL and the test would fall outside that directory. In these cases, the number of rejected links may be too high to list in the Results section.

IMPACT:
Links listed here were neither crawled or tested by the Web application scanning engine.

SOLUTION:
A link might have been intentionally matched by a exclude or include list entry. Verify that no links in this list were unintentionally rejected.

RESULT:
Links not permitted:

ICMP (Internet Control and Error Message Protocol) is a protocol encapsulated in IP packets. ICMP's principal purpose is to provide a protocol layer that informs gateways of the inter-connectivity and accessibility of other gateways or hosts.

We have sent the following types of packets to trigger the host to send us ICMP replies:

Echo Request (to trigger Echo Reply)
Timestamp Request (to trigger Timestamp Reply)
Address Mask Request (to trigger Address Mask Reply)
UDP Packet (to trigger Port Unreachable Reply)

THREAT:
The port scanner enables unauthorized users with the appropriate tools to draw a map of all services on this host that can be accessed from the Internet. The test was carried out with a "stealth" port scanner so that the server does not log real connections.

The Results section displays the port number (Port), the default service listening on the port (IANA Assigned Ports/Services), the description of the service (Description) and the service that the scanner detected using service discovery (Service Detected).

IMPACT:
Unauthorized users can exploit this information to test vulnerabilities in each of the open services.

SOLUTION:
Shut down any unknown or unused service on the list. If you have difficulty figuring out which service is provided by which process or program, contact your provider's support team. For more information about commercial and open-source Intrusion Detection Systems available for detecting port scanners of this kind, visit the CERT Web site.

Last Update:	2024-09-20 19:30:41.0

THREAT:
SSH is a secure protocol, provided it is fully patched, properly configured, and uses FIPS approved algorithms.

Supported ciphers suites reported in this qid are in server-preferred order.

```
For Red Hat ES 4:-
SSH1 supported                                  yes
Supported authentification methods for SSH1     RSA,password

Last Update:	2019-02-07 10:57:24.0

THREAT:

Memcached is a general-purpose distributed memory caching system. It is often used to speed up dynamic database-driven websites by caching data and objects in RAM to reduce the number of times an external data source must be read.

The target is running Memcached service with authentication disabled.

QID Detection Logic (Unauthenticated):
This QID sends a crafted TCP packet to the target memcached service to check it's accessible without any authentication.

IMPACT:

An unauthenticated, remote attacker could exploit this vulnerability to retrieve sensitive information.

SOLUTION:

Customers are advised to enable authentication for memcached service.

CVE ID:	-

Last Update:	2019-05-17 06:30:27.0

THREAT:

Memcached is a high performance, distributed memory object caching system intended for use in speeding up dynamic Web applications by alleviating database load.

By default, it serves on TCP port 11211.

Memcached does not effectively ensure defensibility from random Internet connections. Insecure configuration might expose Memcached directly to the Internet, causing leakage of confidential information.

IMPACT:

By exploiting this vulnerability, an attacker can gain confidential information of the target.

SOLUTION:

Workaround:

1. In a local environment, an administrator can employ parameter "-l 127.0.0.1" to disallow connection from other hosts.
2. In a distributed network environment, a firewall must be configured to protect the Memcached listening port from untrusted connections.

For more information about secure configuration, please refer to Memcached Wiki.

HTTP Security Header Not Detected — port 443 / tcp

PCI COMPLIANCE STATUS

PCI Severity Level: MED

The vulnerability is not included in the NVD.

VULNERABILITY DETAILS

CVSS Base Score:	**4.3** AV:N/AC:M/Au:N/C:N/I:P/A:N
CVSS Temporal Score:	**3.5** E:U/RL:U/RC:UR
Severity:	**2**
QID:	11827
Category:	CGI
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2025-01-02 19:23:28.0

THREAT:

This QID reports the absence of the following HTTP headers according to CWE-693: Protection Mechanism Failure:

X-Content-Type-Options: This HTTP header will prevent the browser from interpreting files as a different MIME type to what is specified in the Content-Type HTTP header.

Strict-Transport-Security: The HTTP Strict-Transport-Security response header (HSTS) allows web servers to declare that web browsers (or other complying user agents) should only interact with it using secure HTTPS connections, and never via the insecure HTTP protocol.

QID Detection Logic:
This unauthenticated QID will send a GET request sent to '/' (default) endpoint and looks for the presence of the following HTTP Headers in the received response:
The Valid directives are as belows: X-Content-Type-Options: nosniff

Strict-Transport-Security: max-age=< [;includeSubDomains]
IMPACT:
Depending on the vulnerability being exploited, an unauthenticated remote attacker could conduct cross-site scripting, clickjacking or MIME-type sniffing attacks.

SOLUTION:
Note: To better debug the results of this QID, it is requested that customers execute commands to simulate the following functionality: curl -lkL --verbose.

CWE-693: Protection Mechanism Failure mentions the following - The product does not use or incorrectly uses a protection mechanism that provides sufficient defense against directed attacks against the product. A "missing" protection mechanism occurs when the application does not define any mechanism against a certain class of attack. An "insufficient" protection mechanism might provide some defenses - for example, against the most common attacks - but it does not protect against everything that is intended. Finally, an "ignored" mechanism occurs when a mechanism is available and in active use within the product, but the developer has not applied it in some code path.

Customers are advised to set proper X-Content-Type-Options and Strict-Transport-Security HTTP response headers.

Depending on their server software, customers can set directives in their site configuration or Web.config files. Few examples are:

X-Content-Type-Options:
Apache: Header always set X-Content-Type-Options: nosniff

HTTP Strict-Transport-Security:
Apache: Header always set Strict-Transport-Security "max-age=31536000; includeSubDomains"
Nginx: add_header Strict-Transport-Security max-age=31536000;

Note: Network devices that include a HTTP/HTTPS console for administrative/management purposes often do not include all/some of the security headers. This is a known issue and it is recommend to contact the vendor for a solution.
RESULT:
X-Content-Type-Options HTTP Header missing on port 443.

Configuration Overview

Ubuntu's Apache2 default configuration is different from the
upstream default configuration, and split into several files optimized for
interaction with Ubuntu tools. The configuration system is
fully documented in
/usr/share/doc/apache2/README.Debian.gz. Refer to this for the full
documentation. Documentation for the web server itself can be
found by accessing the manual if the <tt>apache2-doc</tt>
package was installed on this server.

The configuration layout for an Apache2 web server installation on Ubuntu systems is as follows:

<pre>
/etc/apache2/
|-- apache2.conf
| `-- ports.conf
|-- mods-enabled
| |-- *.load
| `-- *.conf
|-- conf-enabled
| `-- *.conf
|-- sites-enabled
| `-- *.conf
</pre>

<tt>apache2.conf</tt> is the main configuration
file. It puts the pieces together by including all remaining configuration
files when starting up the web server.

<tt>ports.conf</tt> is always included from the
main configuration file. It is used to determine the listening ports for
incoming connections, and this file can be customized anytime.

Configuration files in the <tt>mods-enabled/</tt>,
<tt>conf-enabled/</tt> and <tt>sites-enabled/</tt> directories contain
particular configuration snippets which manage modules, global configuration
fragments, or virtual host configurations, respectively.

They are activated by symlinking available
configuration files from their respective
*-available/ counterparts. These should be managed
by using our helpers
<tt>
a2enmod,
a2dismod,

a2enconf,
a2disconf
</tt>. See their respective man pages for detailed information.

The binary is called apache2 and is managed using systemd, so to
start/stop the service use <tt>systemctl start apache2</tt> and
<tt>systemctl stop apache2</tt>, and use <tt>systemctl status apache2</tt>
and <tt>journalctl -u apache2</tt> to check status. <tt>system</tt>
and <tt>apache2ctl</tt> can also be used for service management if
desired.
Calling <tt>/usr/bin/apache2</tt> directly will not work with the
default configuration.

Document Roots

By default, Ubuntu does not allow access through the web browser to
any file outside of those located in <tt>/var/www</tt>,
public_html
directories (when enabled) and <tt>/usr/share</tt> (for web
applications). If your site is using a web document root
located elsewhere (such as in <tt>/srv</tt>) you may need to whitelist your
document root directory in <tt>/etc/apache2/apache2.conf</tt>.

The default Ubuntu document root is <tt>/var/www/html</tt>. You
can make your own virtual hosts under /var/www.

Reporting Problems

Please use the <tt>ubuntu-bug</tt> tool to report bugs in the
Apache2 package with Ubuntu. However, check <a
href="https://bugs.launchpad.net/ubuntu/+source/apache2"
rel="nofollow">existing bug reports before reporting a new bug.

Please report bugs specific to modules (such as PHP and others)
to their respective packages, not to the web server itself.

HTTP Security Header Not Detected — port 80 / tcp

PCI COMPLIANCE STATUS

FAIL

The vulnerability is not included in the NVD.

VULNERABILITY DETAILS

CVSS Temporal Score:	**3.5** E:U/RL:U/RC:UR
Severity:	**2**
QID:	11827
Category:	CGI
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2025-01-02 19:23:28.0

THREAT:

This QID reports the absence of the following HTTP headers according to CWE-693: Protection Mechanism Failure:
X-Content-Type-Options: This HTTP header will prevent the browser from interpreting files as a different MIME type to what is specified in the Content-Type HTTP header.
Strict-Transport-Security: The HTTP Strict-Transport-Security response header (HSTS) allows web servers to declare that web browsers (or other complying user agents) should only interact with it using secure HTTPS connections, and never via the insecure HTTP protocol.

QID Detection Logic:
This unauthenticated QID will send a GET request sent to '/' (default) endpoint and looks for the presence of the following HTTP Headers in the received response:
The Valid directives are as belows: X-Content-Type-Options: nosniff

Strict-Transport-Security: max-age=< [;includeSubDomains]

IMPACT:
Depending on the vulnerability being exploited, an unauthenticated remote attacker could conduct cross-site scripting, clickjacking or MIME-type sniffing attacks.

SOLUTION:
Note: To better debug the results of this QID, it is requested that customers execute commands to simulate the following functionality: curl -lkL --verbose.

CWE-693: Protection Mechanism Failure mentions the following - The product does not use or incorrectly uses a protection mechanism that provides sufficient defense against directed attacks against the product. A "missing" protection mechanism occurs when the application does not define any mechanism against a certain class of attack. An "insufficient" protection mechanism might provide some defenses - for example, against the most common attacks - but it does not protect against everything that is intended. Finally, an "ignored" mechanism occurs when a mechanism is available and in active use within the product, but the developer has not applied it in some code path.

Customers are advised to set proper X-Content-Type-Options and Strict-Transport-Security HTTP response headers.

Depending on their server software, customers can set directives in their site configuration or Web.config files. Few examples are:

X-Content-Type-Options:
Apache: Header always set X-Content-Type-Options: nosniff

HTTP Strict-Transport-Security:
Apache: Header always set Strict-Transport-Security "max-age=31536000; includeSubDomains"
Nginx: add_header Strict-Transport-Security max-age=31536000;

Note: Network devices that include a HTTP/HTTPS console for administrative/management purposes often do not include all/some of the security headers. This is a known issue and it is recommend to contact the vendor for a solution.
RESULT:
X-Content-Type-Options HTTP Header missing on port 80.

TCP Sequence Number Approximation Based Denial of Service

PCI COMPLIANCE STATUS

PCI Severity Level: MED

PASS

The vulnerability is purely a denial-of-service (DoS) vulnerability.

VULNERABILITY DETAILS

CVSS Base Score:	**5.0** AV:N/AC:L/Au:N/C:N/I:N/A:P
CVSS Temporal Score:	**4.3** E:F/RL:T/RC:C
Severity:	**3**
QID:	82054
Category:	TCP/IP
CVE ID:	CVE-2004-0230
Vendor Reference:	-
Bugtraq ID:	10183
Last Update:	2024-02-29 00:00:01.0

THREAT:

TCP provides stateful communications between hosts on a network. TCP sessions are established by a three-way handshake and use random 32-bit sequence and acknowledgement numbers to ensure the validity of traffic. A vulnerability was reported that may permit TCP sequence numbers to be more easily approximated by remote attackers. This issue affects products released by multiple vendors.

The cause of the vulnerability is that affected implementations will accept TCP sequence numbers within a certain range, known as the acknowledgement range, of the expected sequence number for a packet in the session. This is determined by the TCP window size, which is negotiated during the three-way handshake for the session. Larger TCP window sizes may be set to allow for more throughput, but the larger the TCP window size, the more probable it is to guess a TCP sequence number that falls within an acceptable range. It was initially thought that guessing an acceptable sequence number was relatively difficult for most implementations given random distribution, making this type of attack impractical. However, some implementations may make it easier to successfully approximate an acceptable TCP sequence number, making these attacks possible with a number of protocols and implementations.

This is further compounded by the fact that some implementations may support the use of the TCP Window Scale Option, as described in RFC 1323, to extend the TCP window size to a maximum value of 1 billion.

This vulnerability will permit a remote attacker to inject a SYN or RST packet into the session, causing it to be reset and effectively allowing for denial of service attacks. An attacker would exploit this issue by sending a packet to a receiving implementation with an approximated sequence number and a forged source IP address and TCP port.

There are a few factors that may present viable target implementations, such as those which depend on long-lived TCP connections, those that have known or easily guessed IP address endpoints and those implementations with easily guessed TCP source ports. It has been noted that Border Gateway Protocol (BGP) is reported to be particularly vulnerable to this type of attack, due to the use of long-lived TCP sessions and the possibility that some implementations may use the TCP Window Scale Option. As a result, this issue is likely to affect a number of routing platforms.

Another factor to consider is the relative difficulty of injecting packets into TCP sessions, as a number of receiving implementations will reassemble packets in order, dropping any duplicates. This may make some implementations more resistant to attacks than others.

It should be noted that while a number of vendors have confirmed this issue in various products, investigations are ongoing and it is likely that many other vendors and products will turn out to be vulnerable as the issue is investigated further.

IMPACT:

Successful exploitation of this issue could lead to denial of service attacks on the TCP based services of target hosts.

SOLUTION:

Please first check the results section below for the port number on which this vulnerability was detected. If that port number is known to be used for port-forwarding, then it is the backend host that is really vulnerable.

Various implementations and products including Check Point, Cisco, Cray Inc, Hitachi, Internet Initiative Japan, Inc (IIJ), Juniper Networks, NEC and Yamaha are currently undergoing review. Contact the vendors to obtain more information about affected products and fixes. NISCC Advisory 236929 - Vulnerability Issues in TCP details the vendor patch status as of the time of the advisory, and identifies resolutions and workarounds.

Refer to US-CERT Vulnerability Note VU#415294 and OSVDB Article 4030 to obtain a list of vendors affected by this issue and a note on resolutions (if any) provided by the vendor.

For Microsoft: Refer to MS05-019 and MS06-064 for further details.

For SGI IRIX: Refer to SGI Security Advisory 20040905-01-P

For SCO UnixWare 7.1.3 and 7.1.1: Refer to SCO Security Advisory SCOSA-2005.14

For Solaris (Sun Microsystems): The vendor has acknowledged the vulnerability; however a patch is not available. Refer to Sun Microsystems, Inc. Information for VU#415294 to obtain additional details. Also, refer to TA04-111A for detailed mitigating strategies against these attacks.

For NetBSD: Refer to NetBSD-SA2004-006

For Cisco: Refer to cisco-sa-20040420-tcp-ios.shtml.

For IBM : Refer to IBM-tcp-sequence-number-cve-2004-0230.

For Red Hat Linux: There is no fix available : Refer to .

Workaround:
The following BGP-specific workaround information has been provided.

For BGP implementations that support it, the TCP MD5 Signature Option should be enabled. Passwords that the MD5 checksum is applied to should be set to strong values and changed on a regular basis.

Secure BGP configuration instructions have been provided for Cisco and Juniper at these locations:
Secure Cisco IOS BGP Template
JUNOS Secure BGP Template

RESULT:
Tested on port 80 with an injected SYN/RST offset by 16 bytes.

Last Update:	2024-08-03 05:00:01.0

THREAT:
Reverse Tabnabbing is an attack where the target page is replaced by phishing site. This is possible when target="_blank" is in use with rel="noopener" or rel="noreferrer", attacker can use JavaScript window.opener and inject malicious domain in it. When user clicks on html link, they will get redirected to phishing or unintentional website.
WAS detects this vulnerability during crawling and evaluates HTML links embedded in anchor tags.

IMPACT:
The user may be redirected to an untrusted page that contains undesired content or malicious script code.

SOLUTION:
Use either of these attributes rel="noreferrer" or rel="noopener".
Implement Cross Origin Opener Policy header.

Vendor Reference:	Apache_http_server
Bugtraq ID:	-
Last Update:	2024-08-20 12:27:20.0

THREAT:
Apache HTTP Server is an HTTP web server application.

CVE-2022-28330: Apache HTTP Server 2.4.53 and earlier on Windows may read beyond bounds when configured to process requests with the mod_isapi module.
CVE-2022-28614: The ap_rwrite() function in Apache HTTP Server 2.4.53 and earlier may read unintended memory if an attacker can cause the server to reflect very large input using ap_rwrite() or ap_rputs(), such as with mod_luas r:puts() function.
CVE-2022-28615: Apache HTTP Server 2.4.53 and earlier may crash or disclose information due to a read beyond bounds in ap_strcmp_match() when provided with an extremely large input buffer.
CVE-2022-29404: In Apache HTTP Server 2.4.53 and earlier, a malicious request to a lua script that calls r:parsebody(0) may cause a denial of service due to no default limit on possible input size.
CVE-2022-30556: Apache HTTP Server 2.4.53 and earlier may return lengths to applications calling r:wsread() that point past the end of the storage allocated for the buffer.

Affected Versions:
Apache HTTP Server versions 2.4.53 and earlier

QID Detection Logic:(Unauthenticated)
This QID checks for server banners to detect if the target is running the vulnerable version of apache httpd.

IMPACT:
Successful exploitation of this vulnerability may compromise Confidentiality, Integrity, and Availability of the Data.

SOLUTION:
Customers are advised to update latest Apache httpd

Last Update:	2024-12-11 13:21:59.0

THREAT:

OpenSSH (OpenBSD Secure Shell) is a set of computer programs providing encrypted communication sessions over a computer network using the SSH protocol.

Affected Versions:

OpenSSH version 8.9 and above prior to 9.3

QID Detection Logic:

This unauthenticated detection works by reviewing the version of the OpenSSH service.

IMPACT:

Successfully exploitation of this vulnerability could lead to disclosure of sensitive information, addition or modification of data, or Denial of Service (DoS).

SOLUTION:

Customers are advised to upgrade to OpenSSH 9.3 or later to remediate these vulnerabilities.

THREAT:
Apache HTTP Server is an HTTP web server application.

CVE-2022-36760: Inconsistent Interpretation of HTTP Requests ('HTTP Request Smuggling') vulnerability in mod_proxy_ajp of Apache HTTP Server allows an attacker to smuggle requests to the AJP server it forwards requests to.

Affected Versions:
Apache HTTP Server from 2.4 through 2.4.54

QID Detection Logic:(Unauthenticated)
This QID checks for server banner to detect if the target is running vulnerable version of apache httpd.
IMPACT:
Successful exploitation of this vulnerability allows an attacker to smuggle requests to the AJP server it forwards requests.
SOLUTION:
Customers are advised to update the latest Apache HTTP Server versions 2.4.55 or later.

Vendor Reference:	OpenSSH 9.6
Bugtraq ID:	-
Last Update:	2024-12-11 13:21:59.0

THREAT:
OpenSSH is a set of computer programs providing encrypted communication sessions over a computer network using the SSH protocol.

In OpenSSH, when common types of DRAM are used, might allow row hammer attacks (for authentication bypass) because the integer value of authenticated in mm_answer_authpassword does not resist flips of a single bit.

Affected Versions:
OpenSSH up to version 9.6

QID Detection Logic:
This unauthenticated detection works by reviewing the version of the OpenSSH service.
IMPACT:
Successful exploitation allows OS command injection and row hammer attacks for authentication bypass.
SOLUTION:
There are no vendor supplied patches available at this time.

RESULT:

Vendor Reference:	Apache Security Advisory
Bugtraq ID:	-
Last Update:	2024-12-30 13:21:09.0

THREAT:

Apache HTTP Server is a free and open-source cross-platform web server software, released under the terms of Apache License 2.0.

CVE-2022-22719 - A carefully crafted request body can cause a read to a random memory area which could cause the process to crash.
CVE-2022-22720 - Apache HTTP Server 2.4.52 and earlier fails to close inbound connection when errors are encountered discarding the request body, exposing the server to HTTP Request Smuggling
CVE-2022-22721 - If LimitXMLRequestBody is set to allow request bodies larger than 350MB (defaults to 1M) on 32 bit systems an integer overflow happens which later causes out of bounds writes.
CVE-2022-23943 - Out-of-bounds Write vulnerability in mod_sed of Apache HTTP Server allows an attacker to overwrite heap memory with possibly attacker provided data.

Affected Versions:
Apache HTTP Server 2.4 - 2.4.52

IMPACT:

Successful exploitation of the vulnerability may allow an attacker to redirect victim to a malicious server.

SOLUTION:

Customers are advised to update to Apache HTTP Server 2.4.53 or later. For more information, check Apache Security Advisory

THREAT:
Apache HTTP Server is an HTTP web server application.

CVE-2006-20001: A carefully crafted If: request header can cause a memory read, or write of a single zero byte, in a pool (heap) memory location beyond the header value sent. This could cause the process to crash.
CVE-2022-37436: A malicious backend can cause the response headers to be truncated early, resulting in some headers being incorporated into the response body. If the later headers have any security purpose, they will not be interpreted by the client.

Affected Versions:
Apache HTTP Server versions prior to 2.4.55

QID Detection Logic:(Unauthenticated)
This QID checks for server banner to detect if the target is running vulnerable version of apache httpd.

IMPACT:
Successful exploitation of this vulnerability may result in the breach of Confidentiality, Integrity, and Availability of data.

SOLUTION:
Customers are advised to update the latest Apache HTTP Server versions 2.4.55 or later.

Vendor Reference:	Apache Security Advisory
Bugtraq ID:	-
Last Update:	2024-12-30 13:21:09.0

THREAT:
Apache HTTP Server is a free and open-source cross-platform web server software, released under the terms of Apache License 2.0.

CVE-2022-22719 - A carefully crafted request body can cause a read to a random memory area which could cause the process to crash.
CVE-2022-22720 - Apache HTTP Server 2.4.52 and earlier fails to close inbound connection when errors are encountered discarding the request body, exposing the server to HTTP Request Smuggling
CVE-2022-22721 - If LimitXMLRequestBody is set to allow request bodies larger than 350MB (defaults to 1M) on 32 bit systems an integer overflow happens which later causes out of bounds writes.
CVE-2022-23943 - Out-of-bounds Write vulnerability in mod_sed of Apache HTTP Server allows an attacker to overwrite heap memory with possibly attacker provided data.

Affected Versions:
Apache HTTP Server 2.4 - 2.4.52
IMPACT:
Successful exploitation of the vulnerability may allow an attacker to redirect victim to a malicious server.
SOLUTION:
Customers are advised to update to Apache HTTP Server 2.4.53 or later. For more information, check Apache Security Advisory

Last Update: 2024-09-06 06:03:24.0

THREAT:
Apache HTTP Server is an HTTP web server application.

CVE-2022-36760: Inconsistent Interpretation of HTTP Requests ('HTTP Request Smuggling') vulnerability in mod_proxy_ajp of Apache HTTP Server allows an attacker to smuggle requests to the AJP server it forwards requests to.

Affected Versions:
Apache HTTP Server from 2.4 through 2.4.54

QID Detection Logic:(Unauthenticated)
This QID checks for server banner to detect if the target is running vulnerable version of apache httpd.

IMPACT:
Successful exploitation of this vulnerability allows an attacker to smuggle requests to the AJP server it forwards requests.

SOLUTION:
Customers are advised to update the latest Apache HTTP Server versions 2.4.55 or later.
For further information, please refer to Apache HTTP Server Security Advisory.

Last Update: 2024-12-13 12:00:01.0

THREAT:
The Apache HTTP Server, colloquially called Apache, is a free and open-source cross-platform web server software.

Affected versions of Apache HTTP Server has multiple vulnerabilities:

DoS by Null pointer in websocket over HTTP/2 (CVE-2024-36387): Serving WebSocket protocol upgrades over a HTTP/2 connection could result in a Null Pointer dereference, leading to a crash of the server process, degrading performance.

Windows UNC SSRF (CVE-2024-38472): SSRF in Apache HTTP Server on Windows allows to potentially leak NTML hashes to a malicious server via SSRF and malicious requests or content.
Note: Existing configurations that access UNC paths will have to configure new directive "UNCList" to allow access during request processing.

Proxy encoding problem (CVE-2024-38473): Encoding problem in mod_proxy allows request URLs with incorrect encoding to be sent to backend services, potentially bypassing authentication via crafted requests.

Weakness with encoded question marks in backreferences (CVE-2024-38474): Substitution encoding issue in mod_rewrite. Allows attacker to execute scripts in directories permitted by the configuration but not directly reachable by any URL or source disclosure of scripts meant to only to be executed as CGI.

Weakness in mod_rewrite when first segment of substitution matches filesystem path. (CVE-2024-38475): Improper escaping of output in mod_rewrite. Allows an attacker to map URLs to filesystem locations that are permitted to be served by the server but are not intentionally/directly reachable by any URL, resulting in code execution or source code disclosure.

Crash resulting in Denial of Service in mod_proxy via a malicious request (CVE-2024-38477): null pointer dereference in mod_proxy. Allows an attacker to crash the server via a malicious request.

mod_rewrite proxy handler substitution (CVE-2024-39573): Potential SSRF in mod_rewrite. Allows an attacker to cause unsafe RewriteRules to unexpectedly setup URLs to be handled by mod_proxy.

Affected Versions:
Apache HTTP Server version from 2.4.0 to 2.4.59

QID Detection Logic (Unauthenticated):
This QID sends a HTTP GET request and checks the response headers to confirm if the host is running vulnerable version of Apache HTTP Server.
IMPACT:
Successful exploitation of this vulnerability could lead to a security breach or could affect integrity, availability, and confidentiality.
SOLUTION:
Customers are advised to upgrade to the latest version of Apache HTTP Server to remediate this vulnerability. For more information related to this vulnerability please refer to Apache's Security advisory

Vendor Reference:	Apache HTTP Server Security Advisory
Bugtraq ID:	-
Last Update:	2024-12-30 13:21:09.0

THREAT:

Some mod_proxy configurations on Apache HTTP Server versions 2.4.0 through 2.4.55 allow a HTTP Request Smuggling attack.

Configurations are affected when mod_proxy is enabled along with some form of RewriteRule or ProxyPassMatch in which a non-specific pattern matches some portion of the user-supplied request-target (URL) data and is then re-inserted into the proxied request-target using variable substitution.

Affected Versions:
Apache HTTP Server Versions 2.4.0 through 2.4.55 (including)

QID Detection Logic(Unauthenticated):
This QID checks for vulnerable version of Apache HTTP Server by sending a GET request to a target and extracting the version from the response header.

IMPACT:

Request splitting/smuggling could result in bypass of access controls in the proxy server, proxying unintended URLs to existing origin servers, and cache poisoning.

SOLUTION:

Customers are advised to upgrade to Apache HTTP Server version 2.4.56 or later. For more information please refer to Apache HTTP Server Security Advisory

CVE-2024-38474: Apache HTTP Server weakness with encoded question marks in backreferences

CVE-2024-38475: Apache HTTP Server weakness in mod_rewrite when first segment of substitution matches filesystem path.

CVE-2024-38476: Apache HTTP Server may use exploitable/malicious backend application output to run local handlers via internal redirect

CVE-2024-38477: Apache HTTP Server Crash resulting in Denial of Service in mod_proxy via a malicious request

CVE-2024-39573: Apache HTTP Server mod_rewrite proxy handler substitution

Affected Versions:

Apache HTTP Server versions prior to 2.4.60

QID Detection Logic:(Unauthenticated)

This QID checks for server banners to detect if the target is running the vulnerable version of apache httpd.

Note: Detection is made practice as it checks for server banners only

IMPACT:

Successful exploitation of this vulnerability may compromise Confidentiality, Integrity, and Availability of the Data.

SOLUTION:

Customers are advised to update latest Apache httpd

Apache Hypertext Transfer Protocol (HTTP) Server Request Smuggling Vulnerability — port 80 / tcp

PCI COMPLIANCE STATUS

PCI Severity Level: MED

VULNERABILITY DETAILS

CVSS Base Score:	**6.4** AV:N/AC:L/Au:N/C:P/I:P/A:N
CVSS Temporal Score:	**5.0** E:POC/RL:OF/RC:C
Severity:	**4**
QID:	730758
Category:	CGI
CVE ID:	CVE-2023-25690
Vendor Reference:	Apache HTTP Server Security Advisory
Bugtraq ID:	-
Last Update:	2024-12-30 13:21:09.0

THREAT:
Some mod_proxy configurations on Apache HTTP Server versions 2.4.0 through 2.4.55 allow a HTTP Request Smuggling attack.

Configurations are affected when mod_proxy is enabled along with some form of RewriteRule or ProxyPassMatch in which a non-specific pattern matches some portion of the user-supplied request-target (URL) data and is then re-inserted into the proxied request-target using variable substitution.

Affected Versions:
Apache HTTP Server Versions 2.4.0 through 2.4.55 (including)

QID Detection Logic(Unauthenticated):
This QID checks for vulnerable version of Apache HTTP Server by sending a GET request to a target and extracting the version from the response header.

IMPACT:
Request splitting/smuggling could result in bypass of access controls in the proxy server, proxying unintended URLs to existing origin servers, and cache poisoning.

SOLUTION:
Customers are advised to upgrade to Apache HTTP Server version 2.4.56 or later. For more information please refer to Apache HTTP Server Security Advisory

Exhaustive Web Testing Skipped — port 4001 / tcp

PCI COMPLIANCE STATUS

The vulnerability is not included in the NVD.
ASV Score 5.0 : Web server stopped responding to HTTP requests during the course of scanning. Two minutes later and found it responsive again.

VULNERABILITY DETAILS

CVSS Base Score:	**5.0** AV:N/AC:L/Au:N/C:N/I:N/A:P
CVSS Temporal Score:	**3.6** E:U/RL:W/RC:UC

Category:	Web server
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2024-09-25 00:21:16.0

THREAT:
The service aborted the scanning of the Web server before completion, since the Web server stopped responding to HTTP requests during the course of scanning. The service attempted to reconnect to the Web server two minutes later and found it responsive again. However, the service has stopped further scanning of the Web server to avoid possible interruption of the Web service.

IMPACT:
Since the service did not complete scanning this host, not all vulnerability tests were completed. It's possible that not all vulnerabilities were detected for this host.

SOLUTION:
There may have been a number of conditions that contributed to this issue. The following is a partial list of possibilities that should be investigated:
- The Web server may have reached its connection limit.
- The Web server (or an intervening network device) may have been purposefully throttling connections (e.g. mod_throttle for Apache).
- The Web server (or an intervening network device) may contain an undisclosed Denial of Service condition that was triggered by the scan traffic.
- The Web server (or an intervening network device) may have experienced a degradation of performance due to high load (e.g. via scanning multiple virtual IPs on the same physical host).
- The scan traffic may have been traversing a network segment with limited bandwidth capacity.
- An Intrusion Prevention System, reactive firewall, or similar device may have detected and blocked the scan traffic.

This issue may possibly be mitigated by modifying the scan performance settings in your option profile before scanning the host again.

RESULT:
The web server stopped responding to 4 consecutive HTTP requests 2 minutes ago. Although it resumed responding to a new HTTP request but the service had terminated further scanning of the web server to avoid interrupting the web server's normal functionality and a prolonged scanning time.

THREAT:
Apache HTTP Server is an HTTP web server application.

CVE-2023-31122: Out-of-bounds Read vulnerability in mod_macro of Apache HTTP Server.This issue affects Apache HTTP Server
CVE-2023-45802: A client could send new requests and resets, keeping the connection busy and open and causing the memory footprint to keep on growing. On connection close, all resources were reclaimed, but the process might run out of memory before that.

Affected Versions:
Apache HTTP Server versions prior to 2.4.58

QID Detection Logic:(Unauthenticated)
This QID checks for server banner to detect if the target is running vulnerable version of apache httpd.
IMPACT:
Successful exploitation of this vulnerability may result in the breach of Confidentiality, Integrity, and Availability of data.
SOLUTION:
Customers are advised to update the latest Apache HTTP Server versions 2.4.58 or later.
For further information, please refer to Apache HTTP Server Security Advisory.

Last Update:	2024-06-02 12:01:45.0

THREAT:
The Apache HTTP Server, colloquially called Apache, is a free and open-source cross-platform web server software.

Affected versions of Apache HTTP Server has multiple vulnerabilities:
CVE-2023-31122 : Out-of-bounds Read vulnerability in mod_macro of Apache HTTP Server
CVE-2023-43622 : DoS in HTTP/2 with initial windows size 0
CVE-2023-45802 : When a HTTP/2 stream was reset (RST frame) by a client, there was a time window were the requests memory resources were not reclaimed immediately. Instead, de-allocation was deferred to connection close. A client could send new requests and resets, keeping the connection busy and open and causing the memory footprint to keep on growing. On connection close, all resources were reclaimed, but the process might run out of memory before that.

Affected Versions:
Apache HTTP Server version from 2.4.0 to 2.4.57

QID Detection Logic (Unauthenticated):
This QID sends a HTTP GET request and checks the response headers to confirm if the host is running vulnerable version of Apache HTTP Server.
IMPACT:
Exploitation of the vulnerability could lead to uncontrolled resource consumption or buffer over-read.
SOLUTION:
Customers are advised to upgrade to the latest version of Apache HTTP Server to remediate this vulnerability. For more information related to this vulnerability please refer to Apache's Security advisory

Category:	General remote services
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2024-05-20 12:30:20.0

THREAT:
A remote access or remote management service was detected. If such a service is accessible to malicious users it can be used to carry different type of attacks. Malicious users could try to brute force credentials or collect additional information on the service which could enable them in crafting further attacks.

The Results section includes information on the remote access service that was found on the target.

Services like Telnet, Rlogin, SSH, windows remote desktop, pcAnywhere, Citrix Management Console, Remote Admin (RAdmin), VNC, OPENVPN and ISAKMP are checked.

IMPACT:
Consequences vary by the type of attack.

SOLUTION:
Expose the remote access or remote management services only to the system administrators or intended users of the system.

RESULT:
Service name: SSH on TCP port 22.

Web server default page are common generic pages, including documentation and allow access to common configuration paths.

QID Detection Logic:
This QID checks for the web server by sending a GET request and checking the response body.
QID identifies Apache Web Server Default pages.

IMPACT:
When common default pages are exposed, version information about servers can be revealed. Attackers use this information to identify any known weaknesses and exploit.

SOLUTION:
Create custom default pages.

Last Update:	2025-02-11 13:32:02.0

THREAT:
Several different techniques can be used to identify the operating system (OS) running on a host. A short description of these techniques is provided below. The specific technique used to identify the OS on this host is included in the RESULTS section of your report.

1) **TCP/IP Fingerprint**: The operating system of a host can be identified from a remote system using TCP/IP fingerprinting. All underlying operating system TCP/IP stacks have subtle differences that can be seen in their responses to specially-crafted TCP packets. According to the results of this "fingerprinting" technique, the OS version is among those listed below.

Note that if one or more of these subtle differences are modified by a firewall or a packet filtering device between the scanner and the host, the fingerprinting technique may fail. Consequently, the version of the OS may not be detected correctly. If the host is behind a proxy-type firewall, the version of the operating system detected may be that of the firewall instead of the host being scanned.

2) **NetBIOS**: Short for Network Basic Input Output System, an application programming interface (API) that augments the DOS BIOS by adding special functions for local-area networks (LANs). Almost all LANs for PCs are based on the NetBIOS. Some LAN manufacturers have even extended it, adding additional network capabilities. NetBIOS relies on a message format called Server Message Block (SMB).

3) **PHP Info**: PHP is a hypertext pre-processor, an open-source, server-side, HTML-embedded scripting language used to create dynamic Web pages. Under some configurations it is possible to call PHP functions like phpinfo() and obtain operating system information.

4) **SNMP**: The Simple Network Monitoring Protocol is used to monitor hosts, routers, and the networks to which they attach. The SNMP service maintains Management Information Base (MIB), a set of variables (database) that can be fetched by Managers. These include "MIB_II.system.sysDescr" for the operating system.

Host Uptime Based on TCP TimeStamp Option

PCI COMPLIANCE STATUS

PASS

VULNERABILITY DETAILS

Severity:	**2**
QID:	82063
Category:	TCP/IP
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2007-05-29 18:56:36.0

THREAT:
The TCP/IP stack on the host supports the TCP TimeStamp (kind 8) option. Typically the timestamp used is the host's uptime (since last reboot) in various units (e.g., one hundredth of second, one tenth of a second, etc.). Based on this, we can obtain the host's uptime. The result is given in the Result section below.

Some operating systems (e.g., MacOS, OpenBSD) use a non-zero, probably random, initial value for the timestamp. For these operating systems, the uptime obtained does not reflect the actual uptime of the host; the former is always larger than the latter.

IMPACT:
N/A

SOLUTION:
N/A

RESULT:
Based on TCP timestamps obtained via port 22, the host's uptime is 33 days, 5 hours, and 33 minutes.
The TCP timestamps from the host are in units of 1 milliseconds.

QID:	150018
Category:	Web Application
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2025-02-08 02:07:37.0

THREAT:

The following are some of the possible reasons for the timeouts or connection errors:

1. A disturbance in network connectivity between the scanner and the application occurred.

2. The web server or application server hosting the application was taken down in the midst of a scan.

3. The web application experienced an overload, possibly due to load generated by the scan.

4. An error occurred in the SSL/TLS handshake (applies to HTTPS web applications only).

5. A security device, such as an IDS/IPS or web application firewall (WAF), began to drop or reject the HTTP connections from the scanner.

6. Very large files like PDFs, videos, etc. are present on the site and caused timeouts when accessed by the scanner.

IMPACT:

Some of the resources were not accessible. Results may be incomplete or incorrect.

SOLUTION:

First, confirm that the server was not taken down in the midst of the scan. After that, investigate the root cause by reviewing the listed links and examining web server logs, application server logs, or IDS/IPS/WAF logs. If the errors are caused due to load generated by the scanner then try reducing the scan intensity (this could increase the scan duration). If the errors are due to specific URLs being tested by the scanner or due to specific form data sent by the scanner, then configure exclude lists in the scan configuration as needed to avoid such requests. If timeouts or connection errors are a persistent issue but you want the scan to run to completion, change the Behavior Settings in the option profile to increase the error thresholds or disable the error checks entirely.

RESULT:

Category:	Web Application
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2024-07-17 05:07:15.0

THREAT:
Common file paths such as /var/www/. /var/lib/www, /usr/local/apache2, /Inetpub/wwwroot, /usr/share, etc are default web directory paths. Using such paths or directory structure and leaking information in web application leads to information disclosure about directory paths and framework in use.

IMPACT:
Public-facing web pages and code, products may store sensitive data, code that is not directly invoked, or other files under the web document root of the web server. If the server is not configured or otherwise used to prevent direct access to those files, then attackers may obtain this sensitive data. Default directory paths often have meta data, configuration files that can be read or written by a public or anonymous user.

SOLUTION:
Avoid using common web directory paths and use virtual directories.

RESULT:
Default Web Directory Path Found.

Category:	Information gathering
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2022-09-15 18:02:52.0

THREAT:
The Host Scan Time is the period of time it takes the scanning engine to perform the vulnerability assessment of a single target host. The Host Scan Time for this host is reported in the Result section below.

The Host Scan Time does not have a direct correlation to the Duration time as displayed in the Report Summary section of a scan results report. The Duration is the period of time it takes the service to perform a scan task. The Duration includes the time it takes the service to scan all hosts, which may involve parallel scanning. It also includes the time it takes for a scanner appliance to pick up the scan task and transfer the results back to the service's Secure Operating Center. Further, when a scan task is distributed across multiple scanners, the Duration includes the time it takes to perform parallel host scanning on all scanners.

IMPACT:

RESULT:
Scan duration: 5789 seconds

THREAT:

This check provides various details of the scan's performance and behavior. In some cases, this check can be used to identify problems that the scanner encountered when crawling the target Web application.

IMPACT:

The scan diagnostics data provides technical details about the crawler's performance and behavior. This information does not necessarily imply problems with the Web application.

SOLUTION:

No action is required.

RESULT:

Last Update:	2013-09-27 19:31:33.0

THREAT:
The information shown in the Result section was returned by the network infrastructure responsible for routing traffic from our cloud platform to the target network (where the scanner appliance is located).

This information was returned from: 1) the WHOIS service, or 2) the infrastructure provided by the closest gateway server to our cloud platform. If your ISP is routing traffic, your ISP's gateway server returned this information.

IMPACT:
This information can be used by malicious users to gather more information about the network infrastructure that may aid in launching further attacks against it.

SOLUTION:

Category:	TCP/IP
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2004-11-19 21:53:59.0

THREAT:
TCP Initial Sequence Numbers (ISNs) obtained in the SYNACK replies from the host are analyzed to determine how random they are. The average change between subsequent ISNs and the standard deviation from the average are displayed in the RESULT section. Also included is the degree of difficulty for exploitation of the TCP ISN generation scheme used by the host.

IMPACT:
N/A

SOLUTION:
N/A

RESULT:
Average change between subsequent TCP initial sequence numbers is 1014923860 with a standard deviation of 618777953. These TCP initial sequence numbers were triggered by TCP SYN probes sent to the host at an average rate of 1/(5104 microseconds). The degree of difficulty to exploit the TCP initial sequence number generation scheme is: hard.

CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2024-10-21 20:23:02.0

THREAT:
External domains detected in the application. Using external domains in an application introduces risk by potentially exposing the application to external threats and dependencies, which can be exploited for malicious purposes such as data exfiltration, phishing, or compromise of application integrity. These vulnerabilities arise from inadequate validation, reliance on unsecured external services, and the application's failure to enforce strict security controls over external interactions.

IMPACT:
N/A

SOLUTION:
Audit external domains accessed by your application. If possible launch scans against those.

RESULT:
External domains could be involved in potential business logic abuse.

Apache Default Installation/Welcome Page Detected — port 443 / tcp

Severity:	1
QID:	48065
Category:	Information gathering
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2019-11-21 11:18:00.0

THREAT:
The Apache default installation or "Welcome" page is installed on this server. This usually indicates a newly installed server which has not yet been configured properly and which may not be known about.

Detection Logic(unauthenticated):
QID will check for the apache default Installation/Welcome Page on apache server.

IMPACT:
Apache is installed by default and the user may not be aware that the web server is running. These servers are rarely patched and rarely monitored, providing hackers with a convenient target that is not likely to trip any alarms.

SOLUTION:
Customers are recommended to disable default Apache welcome configuration.

Configuration Overview

Ubuntu's Apache2 default configuration is different from the
upstream default configuration, and split into several files optimized for
interaction with Ubuntu tools. The configuration system is
fully documented in
/usr/share/doc/apache2/README.Debian.gz. Refer to this for the full
documentation. Documentation for the web server itself can be
found by accessing the manual if the <tt>apache2-doc</tt>
package was installed on this server.

The configuration layout for an Apache2 web server installation on Ubuntu systems is as follows:

<pre>
/etc/apache2/
|-- apache2.conf
| `-- ports.conf
|-- mods-enabled
| |-- *.load
| `-- *.conf
|-- conf-enabled
| `-- *.conf
|-- sites-enabled
| `-- *.conf
</pre>

<tt>apache2.conf</tt> is the main configuration
file. It puts the pieces together by including all remaining configuration
files when starting up the web server.

<tt>ports.conf</tt> is always included from the
main configuration file. It is used to determine the listening ports for
incoming connections, and this file can be customized anytime.

Configuration files in the <tt>mods-enabled/</tt>,
<tt>conf-enabled/</tt> and <tt>sites-enabled/</tt> directories contain
particular configuration snippets which manage modules, global configuration
fragments, or virtual host configurations, respectively.

They are activated by symlinking available

configuration files from their respective
*-available/ counterparts. These should be managed
by using our helpers
<tt>
a2enmod,
a2dismod,
</tt>
<tt>
a2ensite,
a2dissite,
</tt>
and
<tt>
a2enconf,
a2disconf
</tt>. See their respective man pages for detailed information.

The binary is called apache2 and is managed using systemd, so to
start/stop the service use <tt>systemctl start apache2</tt> and
<tt>systemctl stop apache2</tt>, and use <tt>systemctl status apache2</tt>
and <tt>journalctl -u apache2</tt> to check status. <tt>system</tt>
and <tt>apache2ctl</tt> can also be used for service management if
desired.
Calling <tt>/usr/bin/apache2</tt> directly will not work with the
default configuration.

Document Roots

By default, Ubuntu does not allow access through the web browser to
any file outside of those located in <tt>/var/www</tt>,
public_html
directories (when enabled) and <tt>/usr/share</tt> (for web
applications). If your site is using a web document root
located elsewhere (such as in <tt>/srv</tt>) you may need to whitelist your
document root directory in <tt>/etc/apache2/apache2.conf</tt>.

The default Ubuntu document root is <tt>/var/www/html</tt>. You
can make your own virtual hosts under /var/www.

Reporting Problems

Please use the <tt>ubuntu-bug</tt> tool to report bugs in the
Apache2 package with Ubuntu. However, check <a
href="https://bugs.launchpad.net/ubuntu/+source/apache2"
rel="nofollow">existing bug reports before reporting a new bug.

Please report bugs specific to modules (such as PHP and others)
to their respective packages, not to the web server itself.

Links Rejected By Crawl Scope or Exclusion List — port 443 / tcp

PCI COMPLIANCE STATUS

VULNERABILITY DETAILS

Severity:	1
QID:	150020
Category:	Web Application
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2022-02-07 16:48:28.0

THREAT:
One or more links were not crawled because of an explicit rule to exclude them. This also occurs if a link is malformed.

Exclude list and Include list entries can cause links to be rejected. If a scan is limited to a specific starting directory, then links outside that directory will neither be crawled or tested.

Links that contain a host name or IP address different from the target application are considered external links and not crawled by default; those types of links are not listed here. This often happens when the scope of a scan is limited to the directory of the starting URL. The scope can be changed in the Web Application Record.

During the test phase, some path-based tests may be rejected if the scan is limited to the directory of the starting URL and the test would fall outside that directory. In these cases, the number of rejected links may be too high to list in the Results section.

IMPACT:
Links listed here were neither crawled or tested by the Web application scanning engine.

SOLUTION:
A link might have been intentionally matched by a exclude or include list entry. Verify that no links in this list were unintentionally rejected.

RESULT:

Apache2 Default Page

It works!

This is the default welcome page used to test the correct
operation of the Apache2 server after installation on Ubuntu systems.
It is based on the equivalent page on Debian, from which the Ubuntu Apache
packaging is derived.
If you can read this page, it means that the Apache HTTP server installed at
this site is working properly. You should replace this file (located at
<tt>/var/www/html/index.html</tt>) before continuing to operate your HTTP server.

If you are a normal user of this web site and don't know what this page is
about, this probably means that the site is currently unavailable due to
maintenance.
If the problem persists, please contact the site's administrator.

Configuration Overview

Ubuntu's Apache2 default configuration is different from the
upstream default configuration, and split into several files optimized for
interaction with Ubuntu tools. The configuration system is
fully documented in
/usr/share/doc/apache2/README.Debian.gz. Refer to this for the full
documentation. Documentation for the web server itself can be
found by accessing the manual if the <tt>apache2-doc</tt>
package was installed on this server.

The configuration layout for an Apache2 web server installation on Ubuntu systems is as follows:

<pre>
/etc/apache2/
|-- apache2.conf
| `-- ports.conf
|-- mods-enabled
| |-- *.load
| `-- *.conf
|-- conf-enabled
| `-- *.conf

|-- sites-enabled
| `-- *.conf
</pre>

<tt>apache2.conf</tt> is the main configuration
file. It puts the pieces together by including all remaining configuration
files when starting up the web server.

<tt>ports.conf</tt> is always included from the
main configuration file. It is used to determine the listening ports for
incoming connections, and this file can be customized anytime.

Configuration files in the <tt>mods-enabled/</tt>,
<tt>conf-enabled/</tt> and <tt>sites-enabled/</tt> directories contain
particular configuration snippets which manage modules, global configuration
fragments, or virtual host configurations, respectively.

They are activated by symlinking available
configuration files from their respective
*-available/ counterparts. These should be managed
by using our helpers
<tt>
a2enmod,
a2dismod,
</tt>
<tt>
a2ensite,
a2dissite,
</tt>
and
<tt>
a2enconf,
a2disconf
</tt>. See their respective man pages for detailed information.

The binary is called apache2 and is managed using systemd, so to
start/stop the service use <tt>systemctl start apache2</tt> and
<tt>systemctl stop apache2</tt>, and use <tt>systemctl status apache2</tt>
and <tt>journalctl -u apache2</tt> to check status. <tt>system</tt>
and <tt>apache2ctl</tt> can also be used for service management if
desired.
Calling <tt>/usr/bin/apache2</tt> directly will not work with the
default configuration.

Document Roots

By default, Ubuntu does not allow access through the web browser to
any file outside of those located in <tt>/var/www</tt>,
public_html
directories (when enabled) and <tt>/usr/share</tt> (for web
applications). If your site is using a web document root
located elsewhere (such as in <tt>/srv</tt>) you may need to whitelist your
document root directory in <tt>/etc/apache2/apache2.conf</tt>.

The default Ubuntu document root is <tt>/var/www/html</tt>. You
can make your own virtual hosts under /var/www.

Reporting Problems

Please use the <tt>ubuntu-bug</tt> tool to report bugs in the
Apache2 package with Ubuntu. However, check <a
href="https://bugs.launchpad.net/ubuntu/+source/apache2"
rel="nofollow">existing bug reports before reporting a new bug.

Please report bugs specific to modules (such as PHP and others)
to their respective packages, not to the web server itself.

Links Rejected By Crawl Scope or Exclusion List — port 4000 / tcp

PCI COMPLIANCE STATUS

PASS

VULNERABILITY DETAILS

Severity:	**1**
QID:	150020
Category:	Web Application
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2022-02-07 16:48:28.0

THREAT:
One or more links were not crawled because of an explicit rule to exclude them. This also occurs if a link is malformed.

Exclude list and Include list entries can cause links to be rejected. If a scan is limited to a specific starting directory, then links outside that directory will neither be crawled or tested.

Links that contain a host name or IP address different from the target application are considered external links and not crawled by default; those types of links are not listed here. This often happens when the scope of a scan is limited to the directory of the starting URL. The scope can be changed in the Web Application Record.

During the test phase, some path-based tests may be rejected if the scan is limited to the directory of the starting URL and the test would fall outside that directory. In these cases, the number of rejected links may be too high to list in the Results section.

IMPACT:
Links listed here were neither crawled or tested by the Web application scanning engine.

SOLUTION:
A link might have been intentionally matched by a exclude or include list entry. Verify that no links in this list were unintentionally rejected.

RESULT:
Links not permitted:

SSH Algorithms ChaCha20-Poly1305 or CBC-EtM Detected

Category:	Information gathering
CVE ID:	-

Bugtraq ID:	-
Last Update:	2024-07-03 11:01:23.0

THREAT:
The ChaCha20-Poly1305 algorithm and the CBC-EtM algorithm are known to be vulnerable to the SSH Prefix Truncation Vulnerability (Terrapin).

QID Detection Logic (Unauthenticated):
This detection attempts to start the SSH key exchange process and examines whether either of the vulnerable ChaCha20-Poly1305 Algorithm or CBC-EtM Algorithm is active. Please note that this is an Information Gathering QID and does not check if a target is vulnerable, as this does not checks for Strict Key Exchange. Customers are advised to refer to QID 38913 to detect vulnerable assets.

IMPACT:
The algorithms are known to be vulnerable to the SSH Prefix Truncation Vulnerability (Terrapin). Successful exploitation of the vulnerability may allow an attacker to downgrade the security of an SSH connection when using SSH extension negotiation. The impact in practice heavily depends on the supported extensions. Most commonly, this will impact the security of client authentication when using an RSA public key.

Web Server Supports HTTP Request Pipelining — port 80 / tcp

Category:	Web server
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2005-02-23 00:25:38.0

THREAT:
Version 1.1 of the HTTP protocol supports URL-Request Pipelining. This means that instead of using the "Keep-Alive" method to keep the TCP connection alive over multiple requests, the protocol allows multiple HTTP URL requests to be made in the same TCP packet. Any Web server which is HTTP 1.1 compliant should then process all the URLs requested in the single TCP packet and respond as usual.

The target Web server was found to support this functionality of the HTTP 1.1 protocol.

IMPACT:
Support for URL-Request Pipelining has interesting consequences. For example, as explained in this paper by Daniel Roelker, it can be used for evading detection by Intrusion Detection Systems. Also, it can be used in HTTP Response-Spliting style attacks.

THREAT:
External domains detected in the application. Using external domains in an application introduces risk by potentially exposing the application to external threats and dependencies, which can be exploited for malicious purposes such as data exfiltration, phishing, or compromise of application integrity. These vulnerabilities arise from inadequate validation, reliance on unsecured external services, and the application's failure to enforce strict security controls over external interactions.

IMPACT:

SOLUTION:
Audit external domains accessed by your application. If possible launch scans against those.

ICMP (Internet Control and Error Message Protocol) is a protocol encapsulated in IP packets. ICMP's principal purpose is to provide a protocol layer that informs gateways of the inter-connectivity and accessibility of other gateways or hosts.

We have sent the following types of packets to trigger the host to send us ICMP replies:

Echo Request (to trigger Echo Reply)
Timestamp Request (to trigger Timestamp Reply)
Address Mask Request (to trigger Address Mask Reply)

THREAT:

Scan activity per port is an estimate of the amount of internal process time the scanner engine spent scanning a particular TCP or UDP port. This information can be useful to determine the reason for long scan times. The individual time values represent internal process time, not elapsed time, and can be longer than the total scan time because of internal parallelism. High values are often caused by slowly responding services or services on which requests time out.

Links that contain a host name or IP address different from the target application are considered external links and not crawled by default; those types of links are not listed here. This often happens when the scope of a scan is limited to the directory of the starting URL. The scope can be changed in the Web Application Record.

During the test phase, some path-based tests may be rejected if the scan is limited to the directory of the starting URL and the test would fall outside that directory. In these cases, the number of rejected links may be too high to list in the Results section.

IMPACT:
Links listed here were neither crawled or tested by the Web application scanning engine.

SOLUTION:
A link might have been intentionally matched by a exclude or include list entry. Verify that no links in this list were unintentionally rejected.

RESULT:
Links not permitted:
(This list includes links from QIDs: 150010,150041,150143,150170)

Category:	Information gathering
CVE ID:	-
Vendor Reference:	Referrer-Policy
Bugtraq ID:	-
Last Update:	2023-01-18 13:30:16.0

THREAT:
No Referrer Policy is specified for the link. It checks for one of the following Referrer Policy in the response headers:

1) no-referrer
2) no-referrer-when-downgrade
3) same-origin

4) origin
5) origin-when-cross-origin
6) strict-origin
7) strict-origin-when-cross-origin

QID Detection Logic(Unauthenticated):
If the Referrer Policy header is not found , checks in response body for meta tag containing tag name as "referrer" and one of the above Referrer Policy.

IMPACT:
The Referrer-Policy header controls how much referrer information is sent to a site when navigating to it. Absence of Referrer-Policy header can lead to leakage of sensitive information via the referrer header.

SOLUTION:
Referrer Policy header improves security by ensuring websites don't leak sensitive information via the referrer header. It's recommended to add secure Referrer Policies as a part of a defense-in-depth approach.

THREAT:

The Apache HTTP Server Project is an effort to develop and maintain an open-source HTTP server for modern operating systems including UNIX and Windows. The goal of this project is to provide a secure, efficient and extensible server that provides HTTP services in sync with the current HTTP standards.

Apache HTTP Server was detected on the target.

QID Detection Logic (Authenticated):
Operating System: Linux
The detection looks for Apache HTTP Server installation path using ps command. The version is extracted from the Apache HTTP Server's binary.
Operating System: Windows
This QID checks Windows registry to see if Apache HTTP Server is installed. If found, it displays the installed version.

Web Server Supports HTTP Request Pipelining — port 443 / tcp

PCI COMPLIANCE STATUS

PASS

VULNERABILITY DETAILS

Severity:	**1**
QID:	86565
Category:	Web server
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2005-02-23 00:25:38.0

THREAT:
Version 1.1 of the HTTP protocol supports URL-Request Pipelining. This means that instead of using the "Keep-Alive" method to keep the TCP connection alive over multiple requests, the protocol allows multiple HTTP URL requests to be made in the same TCP packet. Any Web server which is HTTP 1.1 compliant should then process all the URLs requested in the single TCP packet and respond as usual.

The target Web server was found to support this functionality of the HTTP 1.1 protocol.

IMPACT:
Support for URL-Request Pipelining has interesting consequences. For example, as explained in this paper by Daniel Roelker, it can be used for evading detection by Intrusion Detection Systems. Also, it can be used in HTTP Response-Spliting style attacks.

Category:	TCP/IP
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2024-12-19 13:22:09.0

THREAT:
The port scanner enables unauthorized users with the appropriate tools to draw a map of all services on this host that can be accessed from the Internet. The test was carried out with a "stealth" port scanner so that the server does not log real connections.

The Results section displays the port number (Port), the default service listening on the port (IANA Assigned Ports/Services), the description of the service (Description) and the service that the scanner detected using service discovery (Service Detected).

IMPACT:
Unauthorized users can exploit this information to test vulnerabilities in each of the open services.

SOLUTION:
Shut down any unknown or unused service on the list. If you have difficulty figuring out which service is provided by which process or program, contact your provider's support team. For more information about commercial and open-source Intrusion Detection Systems available for detecting port scanners of this kind, visit the CERT Web site.

THREAT:
The values for the identification (ID) field in IP headers in IP packets from the host are analyzed to determine how random they are. The changes between subsequent ID values for either the network byte ordering or the host byte ordering, whichever is smaller, are displayed in the RESULT section along with the duration taken to send the probes. When incremental values are used, as is the case for TCP/IP implementation in many operating systems, these changes reflect the network load of the host at the time this test was conducted.

THREAT:
No Referrer Policy is specified for the link. It checks for one of the following Referrer Policy in the response headers:

1) no-referrer
2) no-referrer-when-downgrade
3) same-origin
4) origin
5) origin-when-cross-origin
6) strict-origin
7) strict-origin-when-cross-origin

QID Detection Logic(Unauthenticated):
If the Referrer Policy header is not found , checks in response body for meta tag containing tag name as "referrer" and one of the above Referrer Policy.

IMPACT:
The Referrer-Policy header controls how much referrer information is sent to a site when navigating to it. Absence of Referrer-Policy header can lead to leakage of sensitive information via the referrer header.

SOLUTION:
Referrer Policy header improves security by ensuring websites don't leak sensitive information via the referrer header. It's recommended to add secure Referrer Policies as a part of a defense-in-depth approach.

THREAT:
The login form's default action contains a link that is not submitted via HTTPS (HTTP over SSL).

IMPACT:
Sensitive data such as authentication credentials should be encrypted when transmitted over the network. Otherwise they are exposed to sniffing attacks.

SOLUTION:
Change the login form's action to submit via HTTPS.

Apple MacOS X .DS_Store Directory Listing Disclosure Vulnerability — port 80 / tcp

PCI COMPLIANCE STATUS

PCI Severity Level: HIGH

FAIL

VULNERABILITY DETAILS

CVSS Base Score:	**7.5** AV:N/AC:L/Au:N/C:P/I:P/A:P

CVSS Temporal Score:	**6.0** E:U/RL:W/RC:C
Severity:	**3**
QID:	86251
Category:	Web server
CVE ID:	CVE-2001-1446
Vendor Reference:	-
Bugtraq ID:	3324, 3325
Last Update:	2024-01-02 05:00:01.0

THREAT:
A '.DS_Store' file found on the target.

The .DS_Store file is created by the Macintosh OS X Finder.

.DS_Store files contain some vital folder information that can be exploited to obtain sensitive information about system configurations, installed applications, Apple Spotlight comments, etc.

For example: A remote attacker can read this directory content information by submitting a URL to the vulnerable host's Web service in the following format: http://www.example.com/target_directory/.DS_store.

This vulnerability can be present on any web-servers which host content that is copied from a developer's MacOS X workstation.

QID Detection Logic (remote):
The detection detected a .DS_Store file on the target by asking for the .DS_Store file.

IMPACT:
This vulnerability could allow an attacker to obtain sensitive information about your system, including system configuration settings, installed applications Apple Spotlight comments, etc.
If this vulnerability is properly exploited, the information gathered could allow an attacker to further compromise the security of the host.

SOLUTION:
Apple Macintosh users should configure their workstation to disable the creation of .DS_Store files on network shares.

Use Unix file permissions or Apache run-time configuration directives to limit access to the hidden index data file.

Workaround:
Use Unix file permissions or Apache run-time configuration directives to limit access to the hidden index data file.

RESULT:
GET /.DS_Store HTTP/1.1
Host: 15-141-197-169.clients.gthost.com
Connection: Keep-Alive

HTTP/1.1 200 OK
Date: Wed, 12 Feb 2025 17:24:09 GMT

Apple Macintosh OS X Client Apache Directory Contents Disclosure Vulnerability — port 80 / tcp

PCI COMPLIANCE STATUS

PCI Severity Level: MED

FAIL

Automatic Failure: Directory traversal on web server

The vulnerability is not included in the NVD.

VULNERABILITY DETAILS

CVSS Base Score:	**5.0** AV:N/AC:L/Au:N/C:P/I:N/A:N
CVSS Temporal Score:	**4.3** E:U/RL:U/RC:C
Severity:	**3**
QID:	86252
Category:	Web server
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	3316
Last Update:	2023-04-17 09:29:58.0

THREAT:

A vulnerability exists when Apache Web Server is used with the MacOS X Client.

Due to a flaw in Mac OS file permissions, an issue exists which could disclose the contents of a particular Web directory to an unauthorized user. Requesting a URL with the relative path of a '.DS_Store' file, will reveal the contents of the requested directory.

The .DS_Store file is created by the Macintosh OS X Finder.
.DS_Store files contain some vital folder information that can be exploited to obtain sensitive information about system configurations, installed applications, Apple Spotlight comments, etc.

This vulnerability can be present on any web-servers which host content that is copied from a developer's MacOS X workstation.

QID Detection Logic (remote):
The detection detected a .DS_Store file on the target by asking for the .DS_Store file.

IMPACT:

If exploited, this vulnerability could allow the contents of a particular Web directory to be disclosed to an unauthorized user.

This vulnerability could also be used in conjunction with a previously discovered issue (Qualys ID 86251), which causes files to be arbitrarily disclosed through mixed case file requests.

SOLUTION:

Apple Macintosh users should configure their workstation to disable the creation of .DS_Store files on network shares.

Use Unix file permissions or Apache run-time configuration directives to limit access to the hidden index data file.

Disallow remote access to .DS_store files.

Workaround:
Use Unix file permissions or Apache run-time configuration directives to limit access to the hidden index data file.

THREAT:
The Web server presents a directory listing.

IMPACT:
All file names in this directory are exposed.

SOLUTION:
The presence of a browseable directory does not necessarily imply a vulnerability. Determine if the directory listing is intended to be displayed. Verify that no files in the directory contain content that should not be served by the Web application.

CVSS Temporal Score:	**3.5** E:U/RL:U/RC:UR
Severity:	**2**
QID:	11827
Category:	CGI
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2025-01-02 19:23:28.0

THREAT:
This QID reports the absence of the following HTTP headers according to CWE-693: Protection Mechanism Failure:
X-Content-Type-Options: This HTTP header will prevent the browser from interpreting files as a different MIME type to what is specified in the Content-Type HTTP header.
Strict-Transport-Security: The HTTP Strict-Transport-Security response header (HSTS) allows web servers to declare that web browsers (or other complying user agents) should only interact with it using secure HTTPS connections, and never via the insecure HTTP protocol.

QID Detection Logic:
This unauthenticated QID will send a GET request sent to '/' (default) endpoint and looks for the presence of the following HTTP Headers in the received response:
The Valid directives are as belows: X-Content-Type-Options: nosniff

Strict-Transport-Security: max-age=< [;includeSubDomains]

IMPACT:

Depending on the vulnerability being exploited, an unauthenticated remote attacker could conduct cross-site scripting, clickjacking or MIME-type sniffing attacks.

SOLUTION:

Note: To better debug the results of this QID, it is requested that customers execute commands to simulate the following functionality: curl -lkL --verbose.

CWE-693: Protection Mechanism Failure mentions the following - The product does not use or incorrectly uses a protection mechanism that provides sufficient defense against directed attacks against the product. A "missing" protection mechanism occurs when the application does not define any mechanism against a certain class of attack. An "insufficient" protection mechanism might provide some defenses - for example, against the most common attacks - but it does not protect against everything that is intended. Finally, an "ignored" mechanism occurs when a mechanism is available and in active use within the product, but the developer has not applied it in some code path.

Customers are advised to set proper X-Content-Type-Options and Strict-Transport-Security HTTP response headers.

Depending on their server software, customers can set directives in their site configuration or Web.config files. Few examples are:

X-Content-Type-Options:
Apache: Header always set X-Content-Type-Options: nosniff

HTTP Strict-Transport-Security:
Apache: Header always set Strict-Transport-Security "max-age=31536000; includeSubDomains"
Nginx: add_header Strict-Transport-Security max-age=31536000;

Note: Network devices that include a HTTP/HTTPS console for administrative/management purposes often do not include all/some of the security headers. This is a known issue and it is recommend to contact the vendor for a solution.

RESULT:

X-Content-Type-Options HTTP Header missing on port 80.

Category:	Web Application
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2024-04-06 05:00:01.0

THREAT:
A file, directory, or directory listing was discovered on the Web server. These resources are confirmed to be present based on our logic. Some of the content on these files might have sensitive information.

NOTE: Links found in 150004 are found by forced crawling so will not automatically be added to 150009 Links Crawled or the application site map. If links found in 150004 need to be tested they must be added as Explicit URI so they are included in scope and then will be reported in 150009. Once the link is added to be in scope (i. e. Explicit URI) this same link will no longer be reported for 150004.

IMPACT:
The contents of this file or directory may disclose sensitive information.

SOLUTION:
It is advised to review the contents of the disclosed files. If the contents contain sensitive information, please verify that access to this file or directory is permitted. If necessary, remove it or apply access controls to it.

TCP Sequence Number Approximation Based Denial of Service

PCI COMPLIANCE STATUS

PCI Severity Level: MED

PASS

The vulnerability is purely a denial-of-service (DoS) vulnerability.

VULNERABILITY DETAILS

CVSS Base Score:	**5.0** AV:N/AC:L/Au:N/C:N/I:N/A:P
CVSS Temporal Score:	**4.3** E:F/RL:T/RC:C
Severity:	**3**
QID:	82054
Category:	TCP/IP
CVE ID:	CVE-2004-0230
Vendor Reference:	-
Bugtraq ID:	10183
Last Update:	2024-02-29 00:00:01.0

THREAT:

TCP provides stateful communications between hosts on a network. TCP sessions are established by a three-way handshake and use random 32-bit sequence and acknowledgement numbers to ensure the validity of traffic. A vulnerability was reported that may permit TCP sequence numbers to be more easily approximated by remote attackers. This issue affects products released by multiple vendors.

The cause of the vulnerability is that affected implementations will accept TCP sequence numbers within a certain range, known as the acknowledgement range, of the expected sequence number for a packet in the session. This is determined by the TCP window size, which is negotiated during the three-way handshake for the session. Larger TCP window sizes may be set to allow for more throughput, but the larger the TCP window size, the more probable it is to guess a TCP sequence number that falls within an acceptable range. It was initially thought that guessing an acceptable sequence number was relatively difficult for most implementations given random distribution, making this type of attack impractical. However, some implementations may make it easier to successfully approximate an acceptable TCP sequence number, making these attacks possible with a number of protocols and implementations.

This is further compounded by the fact that some implementations may support the use of the TCP Window Scale Option, as described in RFC 1323, to extend the TCP window size to a maximum value of 1 billion.

This vulnerability will permit a remote attacker to inject a SYN or RST packet into the session, causing it to be reset and effectively allowing for denial of service attacks. An attacker would exploit this issue by sending a packet to a receiving implementation with an approximated sequence number and a forged source IP address and TCP port.

There are a few factors that may present viable target implementations, such as those which depend on long-lived TCP connections, those that have known or easily guessed IP address endpoints and those implementations with easily guessed TCP source ports. It has been noted that Border Gateway Protocol (BGP) is reported to be particularly vulnerable to this type of attack, due to the use of long-lived TCP sessions and the possibility that some implementations may use the TCP Window Scale Option. As a result, this issue is likely to affect a number of routing platforms.

Another factor to consider is the relative difficulty of injecting packets into TCP sessions, as a number of receiving implementations will reassemble packets in order, dropping any duplicates. This may make some implementations more resistant to attacks than others.

It should be noted that while a number of vendors have confirmed this issue in various products, investigations are ongoing and it is likely that many other vendors and products will turn out to be vulnerable as the issue is investigated further.

IMPACT:

Successful exploitation of this issue could lead to denial of service attacks on the TCP based services of target hosts.

SOLUTION:

Please first check the results section below for the port number on which this vulnerability was detected. If that port number is known to be used for port-forwarding, then it is the backend host that is really vulnerable.

Various implementations and products including Check Point, Cisco, Cray Inc, Hitachi, Internet Initiative Japan, Inc (IIJ), Juniper Networks, NEC and Yamaha are currently undergoing review. Contact the vendors to obtain more information about affected products and fixes. NISCC Advisory 236929 - Vulnerability Issues in TCP details the vendor patch status as of the time of the advisory, and identifies resolutions and workarounds.

Refer to US-CERT Vulnerability Note VU#415294 and OSVDB Article 4030 to obtain a list of vendors affected by this issue and a note on resolutions (if any) provided by the vendor.

For Microsoft: Refer to MS05-019 and MS06-064 for further details.

For SGI IRIX: Refer to SGI Security Advisory 20040905-01-P

For SCO UnixWare 7.1.3 and 7.1.1: Refer to SCO Security Advisory SCOSA-2005.14

For Solaris (Sun Microsystems): The vendor has acknowledged the vulnerability; however a patch is not available. Refer to Sun Microsystems, Inc. Information for VU#415294 to obtain additional details. Also, refer to TA04-111A for detailed mitigating strategies against these attacks.

For NetBSD: Refer to NetBSD-SA2004-006

For Cisco: Refer to cisco-sa-20040420-tcp-ios.shtml.

For IBM : Refer to IBM-tcp-sequence-number-cve-2004-0230.

For Red Hat Linux: There is no fix available : Refer to .

Workaround:
The following BGP-specific workaround information has been provided.

For BGP implementations that support it, the TCP MD5 Signature Option should be enabled. Passwords that the MD5 checksum is applied to should be set to strong values and changed on a regular basis.

Secure BGP configuration instructions have been provided for Cisco and Juniper at these locations:
Secure Cisco IOS BGP Template
JUNOS Secure BGP Template

RESULT:
Tested on port 80 with an injected SYN/RST offset by 16 bytes.

Last Update:	2017-10-06 22:01:46.0

THREAT:

An HTML form that collects sensitive information does not prevent the browser from prompting the user to save the populated values for later reuse. Autocomplete should be turned off for any input that takes sensitive information such as credit card number, CVV2/CVC code, U.S. social security number, etc.

IMPACT:
If the browser is used in a shared computing environment where more than one person may use the browser, then "autocomplete" values may be submitted by an unauthorized user.

SOLUTION:
Add the following attribute to the form or input element: autocomplete="off" This attribute prevents the browser from prompting the user to save the populated form values for later reuse. Most browsers no longer honor autocomplete="off" for password input fields. These browsers include Chrome, Firefox, Microsoft Edge, IE, Opera However, there is still an ability to turn off autocomplete through the browser and that is recommended for a shared computing environment. Since the ability to turn autocomplete off for password inputs fields is controlled by the user it is highly recommended for application to enforce strong password rules.

THREAT:
Reverse Tabnabbing is an attack where the target page is replaced by phishing site. This is possible when target="_blank" is in use with rel="noopener" or rel="noreferrer", attacker can use JavaScript window.opener and inject malicious domain in it. When user clicks on html link, they will get redirected to phishing or unintentional website.
WAS detects this vulnerability during crawling and evaluates HTML links embedded in anchor tags.

IMPACT:
The user may be redirected to an untrusted page that contains undesired content or malicious script code.

SOLUTION:
Use either of these attributes rel="noreferrer" or rel="noopener".
Implement Cross Origin Opener Policy header.

CVE ID:	CVE-1999-0524
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2024-11-26 18:01:42.0

THREAT:

ICMP (Internet Control and Error Message Protocol) is a protocol encapsulated in IP packets. It's principal purpose is to provide a protocol layer able to inform gateways of the inter-connectivity and accessibility of other gateways or hosts. "ping" is a well-known program for determining if a host is up or down. It uses ICMP echo packets.

ICMP timestamp packets are used to synchronize clocks between hosts. Revealing the current time on the system may facilitate attackers to mount further attacks. Since the risk is especially high on internet facing targets, this vulnerability will be flagged only be Internet scanners hosted by Qualys. Internal targets will not be flagged with this vulnerability.

Please see QID:82040 for a list of supported ICMP packet types.

IMPACT:

Unauthorized users can obtain information about your network by sending ICMP timestamp packets. For example, the internal systems clock should not be disclosed since some internal daemons use this value to calculate ID or sequence numbers (i.e., on SunOS servers).

SOLUTION:

You can filter ICMP messages of type "Timestamp" and "Timestamp Reply" at the firewall level. Some system administrators choose to filter most types of ICMP messages for various reasons. For example, they may want to protect their internal hosts from ICMP-based Denial Of Service attacks, such as the *Ping of Death* or *Smurf* attacks.

However, you should never filter **ALL** ICMP messages, as some of them ("Don't Fragment", "Destination Unreachable", "Source Quench", etc) are necessary for proper behavior of Operating System TCP/IP stacks.

It may be wiser to contact your network consultants for advice, since this issue impacts your overall network reliability and security.

Last Update:	2024-12-11 13:21:59.0

THREAT:

OpenSSH (OpenBSD Secure Shell) is a set of computer programs providing encrypted communication sessions over a computer network using the SSH protocol.

Affected Versions:

OpenSSH version 8.9 and above prior to 9.3

QID Detection Logic:

This unauthenticated detection works by reviewing the version of the OpenSSH service.

IMPACT:

Successfully exploitation of this vulnerability could lead to disclosure of sensitive information, addition or modification of data, or Denial of Service (DoS).

SOLUTION:

Customers are advised to upgrade to OpenSSH 9.3 or later to remediate these vulnerabilities.

THREAT:
Apache HTTP Server is an HTTP web server application.

CVE-2022-28330: Apache HTTP Server 2.4.53 and earlier on Windows may read beyond bounds when configured to process requests with the mod_isapi module.
CVE-2022-28614: The ap_rwrite() function in Apache HTTP Server 2.4.53 and earlier may read unintended memory if an attacker can cause the server to reflect very large input using ap_rwrite() or ap_rputs(), such as with mod_luas r:puts() function.
CVE-2022-28615: Apache HTTP Server 2.4.53 and earlier may crash or disclose information due to a read beyond bounds in ap_strcmp_match() when provided with an extremely large input buffer.
CVE-2022-29404: In Apache HTTP Server 2.4.53 and earlier, a malicious request to a lua script that calls r:parsebody(0) may cause a denial of service due to no default limit on possible input size.
CVE-2022-30556: Apache HTTP Server 2.4.53 and earlier may return lengths to applications calling r:wsread() that point past the end of the storage allocated for the buffer.

Affected Versions:
Apache HTTP Server versions 2.4.53 and earlier

Apache Hypertext Transfer Protocol (HTTP) Server Request Smuggling Vulnerability — port 80 / tcp

PCI COMPLIANCE STATUS

FAIL

VULNERABILITY DETAILS

CVSS Base Score:	**6.4** AV:N/AC:L/Au:N/C:P/I:P/A:N

Severity:	**4**
QID:	730758

CVE ID:	CVE-2023-25690
Vendor Reference:	Apache HTTP Server Security Advisory
Bugtraq ID:	-
Last Update:	2024-12-30 13:21:09.0

THREAT:

Some mod_proxy configurations on Apache HTTP Server versions 2.4.0 through 2.4.55 allow a HTTP Request Smuggling attack.

Configurations are affected when mod_proxy is enabled along with some form of RewriteRule or ProxyPassMatch in which a non-specific pattern matches some portion of the user-supplied request-target (URL) data and is then re-inserted into the proxied request-target using variable substitution.

Affected Versions:
Apache HTTP Server Versions 2.4.0 through 2.4.55 (including)

QID Detection Logic(Unauthenticated):
This QID checks for vulnerable version of Apache HTTP Server by sending a GET request to a target and extracting the version from the response header.

IMPACT:

Request splitting/smuggling could result in bypass of access controls in the proxy server, proxying unintended URLs to existing origin servers, and cache poisoning.

SOLUTION:

Customers are advised to upgrade to Apache HTTP Server version 2.4.56 or later. For more information please refer to Apache HTTP Server Security Advisory

Vendor Reference:	Apache Security Advisory
Bugtraq ID:	-
Last Update:	2024-12-30 13:21:09.0

THREAT:
Apache HTTP Server is a free and open-source cross-platform web server software, released under the terms of Apache License 2.0.

CVE-2022-22719 - A carefully crafted request body can cause a read to a random memory area which could cause the process to crash.
CVE-2022-22720 - Apache HTTP Server 2.4.52 and earlier fails to close inbound connection when errors are encountered discarding the request body, exposing the server to HTTP Request Smuggling
CVE-2022-22721 - If LimitXMLRequestBody is set to allow request bodies larger than 350MB (defaults to 1M) on 32 bit systems an integer overflow happens which later causes out of bounds writes.
CVE-2022-23943 - Out-of-bounds Write vulnerability in mod_sed of Apache HTTP Server allows an attacker to overwrite heap memory with possibly attacker provided data.

Affected Versions:
Apache HTTP Server 2.4 - 2.4.52
IMPACT:
Successful exploitation of the vulnerability may allow an attacker to redirect victim to a malicious server.

SOLUTION:

Customers are advised to update to Apache HTTP Server 2.4.53 or later. For more information, check Apache Security Advisory

CVE ID:	CVE-2023-25690
Vendor Reference:	Apache HTTP Server Security Advisory
Bugtraq ID:	-
Last Update:	2024-12-30 13:21:09.0

THREAT:

Some mod_proxy configurations on Apache HTTP Server versions 2.4.0 through 2.4.55 allow a HTTP Request Smuggling attack.

Configurations are affected when mod_proxy is enabled along with some form of RewriteRule or ProxyPassMatch in which a non-specific pattern matches some portion of the user-supplied request-target (URL) data and is then re-inserted into the proxied request-target using variable substitution.

Affected Versions:
Apache HTTP Server Versions 2.4.0 through 2.4.55 (including)

QID Detection Logic(Unauthenticated):
This QID checks for vulnerable version of Apache HTTP Server by sending a GET request to a target and extracting the version from the response header.

IMPACT:

Request splitting/smuggling could result in bypass of access controls in the proxy server, proxying unintended URLs to existing origin servers, and cache poisoning.

SOLUTION:

Customers are advised to upgrade to Apache HTTP Server version 2.4.56 or later. For more information please refer to Apache HTTP Server Security Advisory

Vendor Reference:	OpenSSH 9.6
Bugtraq ID:	-
Last Update:	2024-12-11 13:21:59.0

THREAT:

OpenSSH is a set of computer programs providing encrypted communication sessions over a computer network using the SSH protocol.

In OpenSSH, when common types of DRAM are used, might allow row hammer attacks (for authentication bypass) because the integer value of authenticated in mm_answer_authpassword does not resist flips of a single bit.

Affected Versions:

OpenSSH up to version 9.6

QID Detection Logic:

This unauthenticated detection works by reviewing the version of the OpenSSH service.

IMPACT:

Successful exploitation allows OS command injection and row hammer attacks for authentication bypass.

SOLUTION:

There are no vendor supplied patches available at this time.

Vendor Reference:	Apache HTTP Server

Last Update:	2024-12-13 12:00:01.0

THREAT:
The Apache HTTP Server, colloquially called Apache, is a free and open-source cross-platform web server software.

Affected versions of Apache HTTP Server has multiple vulnerabilities:

DoS by Null pointer in websocket over HTTP/2 (CVE-2024-36387): Serving WebSocket protocol upgrades over a HTTP/2 connection could result in a Null Pointer dereference, leading to a crash of the server process, degrading performance.

Windows UNC SSRF (CVE-2024-38472): SSRF in Apache HTTP Server on Windows allows to potentially leak NTML hashes to a malicious server via SSRF and malicious requests or content.
Note: Existing configurations that access UNC paths will have to configure new directive "UNCList" to allow access during request processing.

Proxy encoding problem (CVE-2024-38473): Encoding problem in mod_proxy allows request URLs with incorrect encoding to be sent to backend services, potentially bypassing authentication via crafted requests.

Weakness with encoded question marks in backreferences (CVE-2024-38474): Substitution encoding issue in mod_rewrite. Allows attacker to execute scripts in directories permitted by the configuration but not directly reachable by any URL or source disclosure of scripts meant to only to be executed as CGI.

Weakness in mod_rewrite when first segment of substitution matches filesystem path. (CVE-2024-38475): Improper escaping of output in mod_rewrite. Allows an attacker to map URLs to filesystem locations that are permitted to be served by the server but are not intentionally/directly reachable by any URL, resulting in code execution or source code disclosure.

Crash resulting in Denial of Service in mod_proxy via a malicious request (CVE-2024-38477): null pointer dereference in mod_proxy. Allows an attacker to crash the server via a malicious request.

mod_rewrite proxy handler substitution (CVE-2024-39573): Potential SSRF in mod_rewrite. Allows an attacker to cause unsafe RewriteRules to unexpectedly setup URLs to be handled by mod_proxy.

Affected Versions:
Apache HTTP Server version from 2.4.0 to 2.4.59

QID Detection Logic (Unauthenticated):
This QID sends a HTTP GET request and checks the response headers to confirm if the host is running vulnerable version of Apache HTTP Server.
IMPACT:
Successful exploitation of this vulnerability could lead to a security breach or could affect integrity, availability, and confidentiality.
SOLUTION:
Customers are advised to upgrade to the latest version of Apache HTTP Server to remediate this vulnerability. For more information related to this vulnerability please refer to Apache's Security advisory

THREAT:

The Apache HTTP Server, colloquially called Apache, is a free and open-source cross-platform web server software.

Affected versions of Apache HTTP Server has multiple vulnerabilities:

DoS by Null pointer in websocket over HTTP/2 (CVE-2024-36387): Serving WebSocket protocol upgrades over a HTTP/2 connection could result in a Null Pointer dereference, leading to a crash of the server process, degrading performance.

Windows UNC SSRF (CVE-2024-38472): SSRF in Apache HTTP Server on Windows allows to potentially leak NTML hashes to a malicious server via SSRF and malicious requests or content.
Note: Existing configurations that access UNC paths will have to configure new directive "UNCList" to allow access during request processing.

Proxy encoding problem (CVE-2024-38473): Encoding problem in mod_proxy allows request URLs with incorrect encoding to be sent to backend services, potentially bypassing authentication via crafted requests.

Weakness with encoded question marks in backreferences (CVE-2024-38474): Substitution encoding issue in mod_rewrite. Allows attacker to execute scripts in directories permitted by the configuration but not directly reachable by any URL or source disclosure of scripts meant to only to be executed as CGI.

Weakness in mod_rewrite when first segment of substitution matches filesystem path. (CVE-2024-38475): Improper escaping of output in mod_rewrite. Allows an attacker to map URLs to filesystem locations that are permitted to be served by the server but are not intentionally/directly reachable by any URL, resulting in code execution or source code disclosure.

Crash resulting in Denial of Service in mod_proxy via a malicious request (CVE-2024-38477): null pointer dereference in mod_proxy. Allows an attacker to crash the server via a malicious request.

mod_rewrite proxy handler substitution (CVE-2024-39573): Potential SSRF in mod_rewrite. Allows an attacker to cause unsafe RewriteRules to unexpectedly setup URLs to be handled by mod_proxy.

Affected Versions:
Apache HTTP Server version from 2.4.0 to 2.4.59

QID Detection Logic (Unauthenticated):
This QID sends a HTTP GET request and checks the response headers to confirm if the host is running vulnerable version of Apache HTTP Server.
IMPACT:
Successful exploitation of this vulnerability could lead to a security breach or could affect integrity, availability, and confidentiality.
SOLUTION:
Customers are advised to upgrade to the latest version of Apache HTTP Server to remediate this vulnerability. For more information related to this vulnerability please refer to Apache's Security advisory

THREAT:
Apache HTTP Server is an HTTP web server application.

CVE-2022-26377: Inconsistent Interpretation of HTTP Requests ('HTTP Request Smuggling') vulnerability in mod_proxy_ajp of Apache HTTP Server allows an attacker to smuggle requests to the AJP server it forwards requests to.

Affected Versions:
Apache HTTP Server versions 2.4 to 2.4.53

QID Detection Logic:(Unauthenticated)
This QID checks for server banners to detect if the target is running vulnerable version of apache httpd.

IMPACT:
Successful exploitation of this vulnerability may allows an attacker to smuggle requests to the AJP server it forwards requests to.

THREAT:
Source code was detected when scanning the application. The detection involves passive check to determine source code in the web application content response.

IMPACT:
Exposure of source code in external facing information can lead to information leakage related to web application. The information can result in potential use of data by attackers to exploit the application. The exploits can include SQLI, RCE, LFI etc.

SOLUTION:
Avoid the exposure of source code from the web application by changing the access to the content or removing the source code from content accessible from the website.

THREAT:

Apache HTTP Server is an HTTP web server application.

CVE-2023-31122: Out-of-bounds Read vulnerability in mod_macro of Apache HTTP Server.This issue affects Apache HTTP Server
CVE-2023-45802: A client could send new requests and resets, keeping the connection busy and open and causing the memory footprint to keep on growing. On connection close, all resources were reclaimed, but the process might run out of memory before that.

Vendor Reference:	Apache_http_server
Bugtraq ID:	-
Last Update:	2024-08-20 12:27:20.0

THREAT:
Apache HTTP Server is an HTTP web server application.

CVE-2023-31122: Out-of-bounds Read vulnerability in mod_macro of Apache HTTP Server.This issue affects Apache HTTP Server
CVE-2023-45802: A client could send new requests and resets, keeping the connection busy and open and causing the memory footprint to keep on growing. On connection close, all resources were reclaimed, but the process might run out of memory before that.

Affected Versions:
Apache HTTP Server versions prior to 2.4.58

QID Detection Logic:(Unauthenticated)
This QID checks for server banner to detect if the target is running vulnerable version of apache httpd.

IMPACT:
Successful exploitation of this vulnerability may result in the breach of Confidentiality, Integrity, and Availability of data.

SOLUTION:
Customers are advised to update the latest Apache HTTP Server versions 2.4.58 or later.
For further information, please refer to Apache HTTP Server Security Advisory.

Vendor Reference:	Apache HTTP Server 2.4 vulnerabilities
Bugtraq ID:	-
Last Update:	2024-06-02 12:01:45.0

THREAT:
The Apache HTTP Server, colloquially called Apache, is a free and open-source cross-platform web server software.

Affected versions of Apache HTTP Server has multiple vulnerabilities:
CVE-2023-31122 : Out-of-bounds Read vulnerability in mod_macro of Apache HTTP Server
CVE-2023-43622 : DoS in HTTP/2 with initial windows size 0
CVE-2023-45802 : When a HTTP/2 stream was reset (RST frame) by a client, there was a time window were the requests memory resources were not reclaimed immediately. Instead, de-allocation was deferred to connection close. A client could send new requests and resets, keeping the connection busy and open and causing the memory footprint to keep on growing. On connection close, all resources were reclaimed, but the process might run out of memory before that.

Affected Versions:
Apache HTTP Server version from 2.4.0 to 2.4.57

QID Detection Logic (Unauthenticated):
This QID sends a HTTP GET request and checks the response headers to confirm if the host is running vulnerable version of Apache HTTP Server.
IMPACT:
Exploitation of the vulnerability could lead to uncontrolled resource consumption or buffer over-read.
SOLUTION:
Customers are advised to upgrade to the latest version of Apache HTTP Server to remediate this vulnerability. For more information related to this vulnerability please refer to Apache's Security advisory

VULNERABILITY DETAILS

Severity:	**3**
QID:	48001
Category:	Information gathering
CVE ID:	-
Vendor Reference:	Content-Security-Policy
Bugtraq ID:	-
Last Update:	2019-03-11 17:50:46.0

THREAT:
The HTTP Content-Security-Policy response header allows web site administrators to control resources the user agent is allowed to load for a given page. This helps guard against cross-site scripting attacks (XSS).

QID Detection Logic:
This QID detects the absence of the Content-Security-Policy HTTP header by transmitting a GET request.

IMPACT:

Remote Access or Management Service Detected

PCI COMPLIANCE STATUS

PASS

VULNERABILITY DETAILS

Severity:	**3**
QID:	42017
Category:	General remote services
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2024-05-20 12:30:20.0

THREAT:
A remote access or remote management service was detected. If such a service is accessible to malicious users it can be used to carry different type of attacks. Malicious users could try to brute force credentials or collect additional information on the service which could enable them in crafting further attacks.

The Results section includes information on the remote access service that was found on the target.

Services like Telnet, Rlogin, SSH, windows remote desktop, pcAnywhere, Citrix Management Console, Remote Admin (RAdmin), VNC, OPENVPN and ISAKMP are checked.

IMPACT:
Consequences vary by the type of attack.

SOLUTION:
Expose the remote access or remote management services only to the system administrators or intended users of the system.

RESULT:
Service name: SSH on TCP port 22.

Server Returns HTTP 5XX Error Code During Scanning — port 80 / tcp

PCI COMPLIANCE STATUS

PASS

VULNERABILITY DETAILS

Severity:	**3**

QID:	150042
Category:	Web Application
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2024-06-20 06:49:17.0

THREAT:
During the WAS scan, links or end points with HTTP 5xx response code were observed and these are listed in the Results section. The HTTP 5xx message indicates a server error. The list of supported 5xx response code are as below:

500 - Internal Server Error
501 - Not Implemented
502 - Bad Gateway
503 - Service Unavailable
504 - Gateway Timeout
505 - HTTP Version Not Supported

IMPACT:
The presence of a HTTP 5xx error during the crawl phase indicates that some problem exists on the website that will be encountered during normal usage of the Web application. Note WAS depends on responses to detect many vulnerabilities. If expected response is not received then vulnerabilities present on such links or end points may not be detected.

SOLUTION:
Review each link to determine why the server encountered an error when responding to the link. Review and investigate the results of QID 150528 which lists 4xx errors and QID 150019 which lists unexpected response codes.

Category:	Information gathering
CVE ID:	-

Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2025-02-11 13:32:02.0

THREAT:
Several different techniques can be used to identify the operating system (OS) running on a host. A short description of these techniques is provided below. The specific technique used to identify the OS on this host is included in the RESULTS section of your report.

1) **TCP/IP Fingerprint**: The operating system of a host can be identified from a remote system using TCP/IP fingerprinting. All underlying operating system TCP/IP stacks have subtle differences that can be seen in their responses to specially-crafted TCP packets. According to the results of this "fingerprinting" technique, the OS version is among those listed below.

Note that if one or more of these subtle differences are modified by a firewall or a packet filtering device between the scanner and the host, the fingerprinting technique may fail. Consequently, the version of the OS may not be detected correctly. If the host is behind a proxy-type firewall, the version of the operating system detected may be that of the firewall instead of the host being scanned.

2) **NetBIOS**: Short for Network Basic Input Output System, an application programming interface (API) that augments the DOS BIOS by adding special functions for local-area networks (LANs). Almost all LANs for PCs are based on the NetBIOS. Some LAN manufacturers have even extended it, adding additional network capabilities. NetBIOS relies on a message format called Server Message Block (SMB).

3) **PHP Info**: PHP is a hypertext pre-processor, an open-source, server-side, HTML-embedded scripting language used to create dynamic Web pages. Under some configurations it is possible to call PHP functions like phpinfo() and obtain operating system information.

4) **SNMP**: The Simple Network Monitoring Protocol is used to monitor hosts, routers, and the networks to which they attach. The SNMP service maintains Management Information Base (MIB), a set of variables (database) that can be fetched by Managers. These include "MIB_II.system.sysDescr" for the operating system.

Category:	Web Application
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2024-05-29 21:27:07.0

THREAT:
Cookies are used to track HTTP sessions. Both session and non-session cookies could be persistent cookies in those cases it is important to verify the complexity of the cookie values.

Detection: WAS scan evaluates cookie length, analyzes for common cookie parameters not limited to PHPSESSID, ASP.NET_SessionId, JSESSIONID, sessionID, etc.

IMPACT:
With weak cookie values, sessions can be predictable. Such cookies can be used by attacker and impersonate as a legitimate user to steal information or carry out some malicious operations.

SOLUTION:
Review cookies reported, all session cookies should have strong length, combination of alpha-number characters.

Use cryptographically secure pseudorandom number generator (CSPRNG) with a size of at least 128 bits and ensure that each sessionID is unique.

Verify non-session cookie values are strong, randomize as applicable.

RESULT:

Host Uptime Based on TCP TimeStamp Option

PCI COMPLIANCE STATUS

PASS

VULNERABILITY DETAILS

Severity:	**2**
QID:	82063
Category:	TCP/IP
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2007-05-29 18:56:36.0

THREAT:
The TCP/IP stack on the host supports the TCP TimeStamp (kind 8) option. Typically the timestamp used is the host's uptime (since last reboot) in various units (e.g., one hundredth of second, one tenth of a second, etc.). Based on this, we can obtain the host's uptime. The result is given in the Result section below.

Some operating systems (e.g., MacOS, OpenBSD) use a non-zero, probably random, initial value for the timestamp. For these operating systems, the uptime obtained does not reflect the actual uptime of the host; the former is always larger than the latter.

IMPACT:
N/A

SOLUTION:
N/A

RESULT:
Based on TCP timestamps obtained via port 22, the host's uptime is 0 days, 19 hours, and 57 minutes.
The TCP timestamps from the host are in units of 1 milliseconds.

SSH Algorithms ChaCha20-Poly1305 or CBC-EtM Detected

PCI COMPLIANCE STATUS

VULNERABILITY DETAILS

Severity:	**1**
QID:	48259
Category:	Information gathering
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2024-07-03 11:01:23.0

THREAT:
The ChaCha20-Poly1305 algorithm and the CBC-EtM algorithm are known to be vulnerable to the SSH Prefix Truncation Vulnerability (Terrapin).

QID Detection Logic (Unauthenticated):
This detection attempts to start the SSH key exchange process and examines whether either of the vulnerable ChaCha20-Poly1305 Algorithm or CBC-EtM Algorithm is active. Please note that this is an Information Gathering QID and does not check if a target is vulnerable, as this does not checks for Strict Key Exchange. Customers are advised to refer to QID 38913 to detect vulnerable assets.

IMPACT:
The algorithms are known to be vulnerable to the SSH Prefix Truncation Vulnerability (Terrapin). Successful exploitation of the vulnerability may allow an attacker to downgrade the security of an SSH connection when using SSH extension negotiation. The impact in practice heavily depends on the supported extensions. Most commonly, this will impact the security of client authentication when using an RSA public key.

SOLUTION:
N/A

RESULT:
SSH Algorithms ChaCha20-Poly1305 or CBC-EtM detected on port: 22
ChaCha20-Poly1305 Algorithm Support: True

Links Rejected By Crawl Scope or Exclusion List — port 80 / tcp

PCI COMPLIANCE STATUS

PASS

VULNERABILITY DETAILS

Severity:	1
QID:	150020
Category:	Web Application
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2022-02-07 16:48:28.0

THREAT:
One or more links were not crawled because of an explicit rule to exclude them. This also occurs if a link is malformed.

Exclude list and Include list entries can cause links to be rejected. If a scan is limited to a specific starting directory, then links outside that directory will neither be crawled or tested.

Links that contain a host name or IP address different from the target application are considered external links and not crawled by default; those types of links are not listed here. This often happens when the scope of a scan is limited to the directory of the starting URL. The scope can be changed in the Web Application Record.

During the test phase, some path-based tests may be rejected if the scan is limited to the directory of the starting URL and the test would fall outside that directory. In these cases, the number of rejected links may be too high to list in the Results section.

IMPACT:
Links listed here were neither crawled or tested by the Web application scanning engine.

SOLUTION:
A link might have been intentionally matched by a exclude or include list entry. Verify that no links in this list were unintentionally rejected.

RESULT:
Links not permitted:

Last Update:	2024-12-11 13:21:59.0

THREAT:
The Apache HTTP Server Project is an effort to develop and maintain an open-source HTTP server for modern operating systems including UNIX and Windows. The goal of this project is to provide a secure, efficient and extensible server that provides HTTP services in sync with the current HTTP standards.

Apache HTTP Server was detected on the target.

QID Detection Logic (Authenticated):
Operating System: Linux
The detection looks for Apache HTTP Server installation path using ps command. The version is extracted from the Apache HTTP Server's binary.

Operating System: Windows
This QID checks Windows registry to see if Apache HTTP Server is installed. If found, it displays the installed version.

Category:	Web Application
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2024-10-21 20:23:02.0

THREAT:
External domains detected in the application. Using external domains in an application introduces risk by potentially exposing the application to external threats and dependencies, which can be exploited for malicious purposes such as data exfiltration, phishing, or compromise of application integrity. These vulnerabilities arise from inadequate validation, reliance on unsecured external services, and the application's failure to enforce strict security controls over external interactions.

IMPACT:
N/A

SOLUTION:
Audit external domains accessed by your application. If possible launch scans against those.

RESULT:
External domains could be involved in potential business logic abuse.

Category:	Information gathering
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2020-06-24 12:42:21.0

THREAT:

Scan activity per port is an estimate of the amount of internal process time the scanner engine spent scanning a particular TCP or UDP port. This information can be useful to determine the reason for long scan times. The individual time values represent internal process time, not elapsed time, and can be longer than the total scan time because of internal parallelism. High values are often caused by slowly responding services or services on which requests time out.

CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2024-12-19 13:22:09.0

THREAT:
The port scanner enables unauthorized users with the appropriate tools to draw a map of all services on this host that can be accessed from the Internet. The test was carried out with a "stealth" port scanner so that the server does not log real connections.

The Results section displays the port number (Port), the default service listening on the port (IANA Assigned Ports/Services), the description of the service (Description) and the service that the scanner detected using service discovery (Service Detected).

IMPACT:
Unauthorized users can exploit this information to test vulnerabilities in each of the open services.

SOLUTION:
Shut down any unknown or unused service on the list. If you have difficulty figuring out which service is provided by which process or program, contact your provider's support team. For more information about commercial and open-source Intrusion Detection Systems available for detecting port scanners of this kind, visit the CERT Web site.

Category:	TCP/IP
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2006-07-27 21:45:19.0

THREAT:
The values for the identification (ID) field in IP headers in IP packets from the host are analyzed to determine how random they are. The changes between subsequent ID values for either the network byte ordering or the host byte ordering, whichever is smaller, are displayed in the RESULT section along with the duration taken to send the probes. When incremental values are used, as is the case for TCP/IP implementation in many operating systems, these changes reflect the network load of the host at the time this test was conducted.

Please note that for reliability reasons only the network traffic from open TCP ports is analyzed.

SOLUTION:

Category:	Web Application
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2022-02-07 16:48:28.0

THREAT:

One or more links were not crawled because of an explicit rule to exclude them. This also occurs if a link is malformed.

Exclude list and Include list entries can cause links to be rejected. If a scan is limited to a specific starting directory, then links outside that directory will neither be crawled or tested.

Links that contain a host name or IP address different from the target application are considered external links and not crawled by default; those types of links are not listed here. This often happens when the scope of a scan is limited to the directory of the starting URL. The scope can be changed in the Web Application Record.

During the test phase, some path-based tests may be rejected if the scan is limited to the directory of the starting URL and the test would fall outside that directory. In these cases, the number of rejected links may be too high to list in the Results section.

IMPACT:

Links listed here were neither crawled or tested by the Web application scanning engine.

SOLUTION:

A link might have been intentionally matched by a exclude or include list entry. Verify that no links in this list were unintentionally rejected.

RESULT:

Links not permitted:

THREAT:
The information shown in the Result section was returned by the network infrastructure responsible for routing traffic from our cloud platform to the target network (where the scanner appliance is located).

This information was returned from: 1) the WHOIS service, or 2) the infrastructure provided by the closest gateway server to our cloud platform. If your ISP is routing traffic, your ISP's gateway server returned this information.

IMPACT:
This information can be used by malicious users to gather more information about the network infrastructure that may help in launching attacks against it.

Last Update:	2009-01-16 18:02:19.0

THREAT:
This check provides various details of the scan's performance and behavior. In some cases, this check can be used to identify problems that the scanner encountered when crawling the target Web application.

IMPACT:
The scan diagnostics data provides technical details about the crawler's performance and behavior. This information does not necessarily imply problems with the Web application.

SOLUTION:
No action is required.

RESULT:

Web Server Supports HTTP Request Pipelining — port 443 / tcp

PCI COMPLIANCE STATUS

PASS

VULNERABILITY DETAILS

Severity:	1
QID:	86565
Category:	Web server
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2005-02-23 00:25:38.0

THREAT:
Version 1.1 of the HTTP protocol supports URL-Request Pipelining. This means that instead of using the "Keep-Alive" method to keep the TCP connection alive over multiple requests, the protocol allows multiple HTTP URL requests to be made in the same TCP packet. Any Web server which is HTTP 1.1 compliant should then process all the URLs requested in the single TCP packet and respond as usual.

The target Web server was found to support this functionality of the HTTP 1.1 protocol.

IMPACT:
Support for URL-Request Pipelining has interesting consequences. For example, as explained in this paper by Daniel Roelker, it can be used for evading detection by Intrusion Detection Systems. Also, it can be used in HTTP Response-Spliting style attacks.

Category:	Information gathering
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2022-09-15 18:02:52.0

THREAT:
The Host Scan Time is the period of time it takes the scanning engine to perform the vulnerability assessment of a single target host. The Host Scan Time for this host is reported in the Result section below.

The Host Scan Time does not have a direct correlation to the Duration time as displayed in the Report Summary section of a scan results report. The Duration is the period of time it takes the service to perform a scan task. The Duration includes the time it takes the service to scan all hosts, which may involve parallel scanning. It also includes the time it takes for a scanner appliance to pick up the scan task and transfer the results back to the service's Secure Operating Center. Further, when a scan task is distributed across multiple scanners, the Duration includes the time it takes to perform parallel host scanning on all scanners.

IMPACT:
N/A

SOLUTION:

RESULT:
Scan duration: 9083 seconds

THREAT:
Using resources from external locations is a security concern, including third-party stylesheet. Also detection of all external resources would be a requirement for certifications and audits.

IMPACT:
Using css from untrusted sources can result in external CSS injection and allow attacker to gain sensitive information.

SOLUTION:
Verify all the external CSS loaded on application are valid and from known sources.

Last Update:	2009-01-16 18:02:19.0

THREAT:
This check provides various details of the scan's performance and behavior. In some cases, this check can be used to identify problems that the scanner encountered when crawling the target Web application.

IMPACT:
The scan diagnostics data provides technical details about the crawler's performance and behavior. This information does not necessarily imply problems with the Web application.

SOLUTION:
No action is required.

RESULT:
Target web application page http://169.197.141.15:443/ fetched. Status code:404, Content-Type:text/html, load time:110 milliseconds.

QID:	82045
Category:	TCP/IP
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2004-11-19 21:53:59.0

THREAT:
TCP Initial Sequence Numbers (ISNs) obtained in the SYNACK replies from the host are analyzed to determine how random they are. The average change between subsequent ISNs and the standard deviation from the average are displayed in the RESULT section. Also included is the degree of difficulty for exploitation of the TCP ISN generation scheme used by the host.

IMPACT:
N/A

SOLUTION:
N/A

RESULT:
Average change between subsequent TCP initial sequence numbers is 1077020428 with a standard deviation of 645709675. These TCP initial sequence numbers were triggered by TCP SYN probes sent to the host at an average rate of 1/(5102 microseconds). The degree of difficulty to exploit the TCP initial sequence number generation scheme is: hard.

Maximum Number of Links Reached During Crawl — port 80 / tcp

PCI COMPLIANCE STATUS

PASS

VULNERABILITY DETAILS

Severity:	**1**
QID:	150026
Category:	Web Application
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2009-01-16 18:02:46.0

THREAT:
The maximum number of links specified for this scan has been reached. The links crawled to reach this threshold can include requests made via HTML form submissions and links requested in anonymous and authenticated states. Consequently, the list of links crawled (QID 150009) may reflect a lower number than the combination of links and forms requested during the crawl.

IMPACT:
Some links that lead to different areas of the site's functionality may have been missed.

SOLUTION:
Increase the maximum number of links in order to ensure broader coverage of the Web application. It is important to note that increasing the number of links crawled can dramatically increase the time required to test the Web application.

RESULT:
Maximum request count reached: 300

Referrer-Policy HTTP Security Header Not Detected — port 80 / tcp

PCI COMPLIANCE STATUS

PASS

VULNERABILITY DETAILS

Severity:	1
QID:	48131
Category:	Information gathering
CVE ID:	-
Vendor Reference:	Referrer-Policy
Bugtraq ID:	-
Last Update:	2023-01-18 13:30:16.0

THREAT:
No Referrer Policy is specified for the link. It checks for one of the following Referrer Policy in the response headers:

1) no-referrer
2) no-referrer-when-downgrade
3) same-origin
4) origin
5) origin-when-cross-origin
6) strict-origin
7) strict-origin-when-cross-origin

QID Detection Logic(Unauthenticated):
If the Referrer Policy header is not found , checks in response body for meta tag containing tag name as "referrer" and one of the above Referrer Policy.

IMPACT:
The Referrer-Policy header controls how much referrer information is sent to a site when navigating to it. Absence of Referrer-Policy header can lead to leakage of sensitive information via the referrer header.

SOLUTION:
Referrer Policy header improves security by ensuring websites don't leak sensitive information via the referrer header. It's recommended to add secure Referrer Policies as a part of a defense-in-depth approach.

References:

CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2020-02-19 18:46:27.0

THREAT:
The cookies listed in the Results section were set by the web application during the crawl phase.

IMPACT:
Cookies may potentially contain sensitive information about the user.

Note: Long scan duration can occur if a web application sets a large number of cookies (e.g., 25 cookies or more) and QIDs 150002, 150046, 150047, and 150048 are enabled.

SOLUTION:
Review cookie values to ensure they do not include sensitive information. If scan duration is excessive due to a large number of cookies, consider excluding QIDs 150002, 150046, 150047, and 150048.

Web Server Supports HTTP Request Pipelining — port 80 / tcp

PCI COMPLIANCE STATUS

PASS

VULNERABILITY DETAILS

Severity:	1
QID:	86565
Category:	Web server
CVE ID:	-
Vendor Reference:	-
Bugtraq ID:	-
Last Update:	2005-02-23 00:25:38.0

THREAT:
Version 1.1 of the HTTP protocol supports URL-Request Pipelining. This means that instead of using the "Keep-Alive" method to keep the TCP connection alive over multiple requests, the protocol allows multiple HTTP URL requests to be made in the same TCP packet. Any Web server which is HTTP 1.1 compliant should then process all the URLs requested in the single TCP packet and respond as usual.

The target Web server was found to support this functionality of the HTTP 1.1 protocol.

IMPACT:
Support for URL-Request Pipelining has interesting consequences. For example, as explained in this paper by Daniel Roelker, it can be used for evading detection by Intrusion Detection Systems. Also, it can be used in HTTP Response-Spliting style attacks.

THREAT:
ICMP (Internet Control and Error Message Protocol) is a protocol encapsulated in IP packets. ICMP's principal purpose is to provide a protocol layer that informs gateways of the inter-connectivity and accessibility of other gateways or hosts.

We have sent the following types of packets to trigger the host to send us ICMP replies:

Echo Request (to trigger Echo Reply)
Timestamp Request (to trigger Timestamp Reply)
Address Mask Request (to trigger Address Mask Reply)
UDP Packet (to trigger Port Unreachable Reply)
IP Packet with Protocol >= 250 (to trigger Protocol Unreachable Reply)

THREAT:

SSH is a secure protocol, provided it is fully patched, properly configured, and uses FIPS approved algorithms.

Supported ciphers suites reported in this qid are in server-preferred order.

```
For Red Hat ES 4:-
SSH1 supported                                  yes
Supported authentification methods for SSH1     RSA,password
Supported ciphers for SSH1                      3des,blowfish

Report Legend

Payment Card Industry (PCI) Status

An overall PCI compliance status of PASSED indicates that all hosts in the report passed the PCI compliance standards. A PCI compliance status of PASSED for a single host/IP indicates that no vulnerabilities or potential vulnerabilities, as defined by the PCI DSS compliance standards set by the PCI Council, were detected on the host.

An overall PCI compliance status of FAILED indicates that at least one host in the report failed to meet the PCI compliance standards. A PCI compliance status of FAILED for a single host/IP indicates that at least one vulnerability or potential vulnerability, as defined by the PCI DSS compliance standards set by the PCI Council, was detected on the host.

Vulnerability Levels

A Vulnerability is a design flaw or mis-configuration which makes your network (or a host on your network) susceptible to malicious attacks from local or remote users. Vulnerabilities can exist in several areas of your network, such as in your firewalls, FTP servers, Web servers, operating systems or CGI bins. Depending on the level of the security risk, the successful exploitation of a vulnerability can vary from the disclosure of information about the host to a complete compromise of the host.

Severity	Level	Description
1	Minimal	Intruders can collect information about the host (open ports, services, etc.) and may be able to use this information to find other vulnerabilities.
2	Medium	Intruders may be able to collect sensitive information from the host, such as the precise version of software installed. With this information,

			intruders can easily exploit known vulnerabilities specific to software versions.
	3	Serious	Intruders may be able to gain access to specific information stored on the host, including security settings. This could result in potential misuse of the host by intruders. For example, vulnerabilities at this level may include partial disclosure of file contents, access to certain files on the host, directory browsing, disclosure of filtering rules and security mechanisms, denial of service attacks, and unauthorized use of services, such as mail-relaying.
	4	Critical	Intruders can possibly gain control of the host, or there may be potential leakage of highly sensitive information. For example, vulnerabilities at this level may include full read access to files, potential backdoors, or a listing of all the users on the host.
	5	Urgent	Intruders can easily gain control of the host, which can lead to the compromise of your entire network security. For example, vulnerabilities at this level may include full read and write access to files, remote execution of commands, and the presence of backdoors.

Severity	Level	Description
LOW	Low	A vulnerability with a CVSS base score of 0.0 through 3.9. These vulnerabilities are not required to be fixed to pass PCI compliance.
MED	Medium	A vulnerability with a CVSS base score of 4.0 through 6.9. These vulnerabilities must be fixed to pass PCI compliance.
HIGH	High	A vulnerability with a CVSS base score of 7.0 through 10.0. These vulnerabilities must be fixed to pass PCI compliance.

Potential Vulnerability Levels

A potential vulnerability is one which we cannot confirm exists. The only way to verify the existence of such vulnerabilities on your network would be to perform an intrusive scan, which could result in a denial of service. This is strictly against our policy. Instead, we urge you to investigate these potential vulnerabilities further.

Severity	Level	Description
1	Minimal	If this vulnerability exists on your system, intruders can collect information about the host (open ports, services, etc.) and may be able to use this information to find other vulnerabilities.
2	Medium	If this vulnerability exists on your system, intruders may be able to collect sensitive information from the host, such as the precise version of software installed. With this information, intruders can easily exploit known vulnerabilities specific to software versions.
3	Serious	If this vulnerability exists on your system, intruders may be able to gain access to specific information stored on the host, including security settings. This could result in potential misuse of the host by intruders. For example, vulnerabilities at this level may include partial disclosure of file contents, access to certain files on the host, directory browsing, disclosure of filtering rules and security mechanisms, denial of service attacks, and unauthorized use of services, such as mail-relaying.
4	Critical	If this vulnerability exists on your system, intruders can possibly gain control of the host, or there may be potential leakage of highly sensitive information. For example, vulnerabilities at this level may include full read access to files, potential backdoors, or a listing of all the users on the host.
5	Urgent	If this vulnerability exists on your system, intruders can easily gain control of the host, which can lead to the compromise of your entire network security. For example, vulnerabilites at this level may include full read and write access to files, remote execution of commands, and the presence of backdoors.

Severity	Level	Description
LOW	Low	A potential vulnerability with a CVSS base score of 0.0 through 3.9. These vulnerabilities are not required to be fixed to pass PCI compliance.
MED	Medium	A potential vulnerability with a CVSS base score of 4.0 through 6.9. These vulnerabilities must be fixed to pass PCI compliance.
HIGH	High	A potential vulnerability with a CVSS base score of 7.0 through 10.0. These vulnerabilities must be fixed to pass PCI compliance.

Information Gathered

Information Gathered includes visible information about the network related to the host, such as traceroute information, Internet Service Provider (ISP), or a list of reachable hosts. Information Gathered severity levels also include Network Mapping data, such as detected firewalls, SMTP banners, or a list of open TCP services.

Severity		Level	Description
	1	Minimal	Intruders may be able to retrieve sensitive information related to the host, such as open UDP and TCP services lists, and detection of firewalls.
	2	Medium	Intruders may be able to determine the operating system running on the host, and view banner versions.
	3	Serious	Intruders may be able to detect highly sensitive data, such as global system user lists.
